

# Experimental unicode mathematical typesetting: The unicode-math package

Will Robertson

2009/10/02      v0.4

## Abstract

**Warning! This package is experimental and subject to change without regard for backwards compatibility. Performance issues may be encountered until algorithms are refined.**

This package is intended to be a complete implementation of unicode maths for  $\text{\LaTeX}$  using the  $\text{\XeTeX}$  (and later,  $\text{\LuaTeX}$ ) typesetting engines. With this package, changing maths fonts will be as easy as changing text fonts — not that there are many unicode maths fonts yet.

Maths input is simplified with unicode since literal glyphs may be entered instead of control sequences.

# 1 Introduction

This document describes the unicode-math package, which is an *experimental* implementation of a macro to unicode glyph encoding for mathematical characters. Its intended use is for  $\XeTeX$ , although it is conjectured that some effort could be spent to create a cross-format package that would also work with  $\text{Lua}\TeX$ .

Users who desire to specify maths alphabets only (Greek and Latin letters) may wish to use Andrew Moschou's `mathspec` package instead.

# 2 Acknowledgements

Many thanks to Microsoft for developing OpenType math as part of Office 2007; Jonathan Kew for implementing unicode math support in  $\text{X}\TeX$ ; Barbara Beeton for her prodigious effort compiling the definitive list of unicode math glyphs and their  $\text{L}\TeX$  names (inventing them where necessary), and also for her thoughtful replies to my sometimes incessant questions. Ross Moore and Chris Rowley have provided moral and technical support from the very early days with great insight into the issues we face trying to extend and use  $\text{T}\TeX$  in the future. Apostolos Syropoulos, Joel Saloman, and Khaled Hosny have been fantastic beta testers.

# 3 Getting started

Load unicode-math as a regular  $\text{L}\TeX$  package. It should be loaded after any other maths or font-related package in case it needs to overwrite their definitions. Here's an example:

```
\usepackage{amsmath} % if desired
\usepackage{unicode-math}
\setmathfont{Cambria Math}
```

## 3.1 Package options

Package options may be set when the package is loaded or at any later stage with the `\unimathsetup` command. Therefore, the following two examples are equivalent:

```
\usepackage[math-style=TeX]{unicode-math}
% OR
\usepackage{unicode-math}
\unimathsetup{math-style=TeX}
```

Table 1: Package options.

Option	Description	See...
<code>math-style</code>	Style of letters	section §5.1
<code>bold-style</code>	Style of bold letters	section §5.2
<code>sans-style</code>	Style of sans serif letters	section §5.3
<code>nabla</code>	Style of the nabla symbol	section §5.5.1
<code>partial</code>	Style of the partial symbol	section §5.5.2
<code>vargreek-shape</code>	Style of phi and epsilon	section §5.5.3
<code>colon</code>	Behaviour of <code>\colon</code>	section §5.5.6
<code>slash-delimiter</code>	Glyph to use for ‘stretchy’ slash	section §5.5.7

Note, however, that some package options affects how maths is initialised and changing an option such as `math-style` will not take effect until a new maths font is set up.

Package options may *also* be used when declaring new maths fonts, passed via options to the `\setmathfont` command. Therefore, the following two examples are equivalent:

```
\unimathsetup{math-style=TeX}
\setmathfont{Cambria Math}
% OR
\setmathfont[math-style=TeX]{Cambria Math}
```

A short list of package options is shown in table 1. See following sections for more information.

## 4 Unicode maths font setup

In the ideal case, a single unicode font will contain all maths glyphs we need. The file `unicode-math-table.tex` (based on Barbara Beeton’s `stix` table) provides the mapping between unicode maths glyphs and macro names (all 3298 — or however many — of them!). A single command

```
\setmathfont[<font features>]{<font name>}
```

implements this for every every symbol and alphabetic variant. That means `x` to  $x$ , `\xi` to  $\xi$ , `\leq` to  $\leq$ , etc., `\mathcal{H}` to  $\mathcal{H}$  and so on, all for unicode glyphs within a single font.

This package deals well with unicode characters for maths input. This includes using literal Greek letters in formulae, resolving to upright or italic depending on preference.

Font features specific to `unicode-math` are shown in table 2. Package options (see table 1) may also be used. Other `fontspec` features are also valid.

Table 2: Maths font options.

Option	Description	See...
<code>range</code>	Style of letters	section §4.1
<code>script-font</code>	Font to use for sub- and super-scripts	section §4.2
<code>script-features</code>	Font features for sub- and super-scripts	section §4.2
<code>sscript-font</code>	Font to use for nested sub- and super-scripts	section §4.2
<code>sscript-features</code>	Font features for nested sub- and super-scripts	section §4.2

## 4.1 Using multiple fonts

There will probably be few cases where a single unicode maths font suffices (simply due to glyph coverage). The upcoming `stix` font comes to mind as a possible exception. It will therefore be necessary to delegate specific unicode ranges of glyphs to separate fonts:

`\setmathfont[range=<unicode range>,<font features>]{<font name>}`

where *<unicode range>* is a comma-separated list of unicode slots and ranges such as `{"27D0-"27EB", "27FF", "295B-"297F"}`. You may also use the macro for accessing the glyph, such as `\int`, or whole collection of symbols with the same math type, such as `\mathopen`, or complete math alphabets such as `\mathbb`. (Only numerical slots, however, can be used in ranged declarations.)

### 4.1.1 Control over maths alphabets

Exact control over maths alphabets can be somewhat involved. Here is the current plan.

- `[range=\mathbb]` to use the font for ‘bb’ letters only.
- `[range=\mathbfssfit/gG]` for Greek lowercase and uppercase only (with  $\iota$ ,  $\Lambda$  as well for Latin lower-/upper-case, and numbers).
- `[range=\mathsf{fit}->\mathbfssfit]` to map to different output alphabet(s) (which is rather useless right now but will become less useless in the future).

And now the trick. If a particular math alphabet is not defined in the font, fall back onto the lower-base plane (i.e., upright) glyphs. Therefore, to use an ASCII-encoded fractur font, for example, write

`\setmathfont[range=\mathfrak]{SomeFrakturFont}`

and because the math plane fractur glyphs will be missing, unicode-math will know to use the ASCII ones instead.

And due to this behaviour, simply loading the Euler math font as usual will cause the upright glyphs to be substituted for the missing italic ones.

## 4.2 Script and scriptscript fonts/features

Cambria Math uses OpenType font features to activate smaller optical sizes for scriptsize and scriptscriptsize symbols (the  $B$  and  $C$ , respectively, in  $A_{B_C}$ ). Other fonts will possibly use entirely separate fonts.

Not yet implemented: Both of these options must be taken into account. I hope this will be mostly automatic from the users' points of view. The `+ssty` feature can be detected and applied automatically, and appropriate optical size information embedded in the fonts will ensure this latter case. Fine tuning should be possible automatically with `fontspec` options. We might have to wait until MnMath, for example, before we really know.

## 5 Maths input

X<sub>Y</sub>TeX's unicode support allows maths input through two methods. Like classical TeX, macros such as `\alpha`, `\sum`, `\pm`, `\leq`, and so on, provide verbose access to the entire repertoire of characters defined by unicode. The literal characters themselves may be used instead, for more readable input files.

### 5.1 Math 'style'

Classically, TeX uses italic lowercase Greek letters and *upright* uppercase Greek letters for variables in mathematics. This is contrary to the ISO standards of using italic forms for both upper- and lowercase. Furthermore, the French (contrary again, *quelle surprise*) have been known to use upright uppercase *Latin* letters as well as upright upper- and lowercase Greek. Finally, it is not unknown to use upright letters for all characters, as seen in the Euler fonts.

The unicode-math package accommodates these possibilities with an interface heavily inspired by Walter Schmidt's `lucimatx` package: a package option `math-style` that takes one of four arguments: `TeX`, `ISO`, `French`, or `upright` (case insensitive).

The philosophy behind the interface to the mathematical alphabet symbols lies in L<sup>A</sup>TeX's attempt of separating content and formatting. Because input source text may come from a variety of places, the upright and 'mathematical' italic Latin and Greek alphabets are *unified* from the point of view of having a specified meaning in the source text. That is, to get a mathematical ' $x$ ', either the ascii ('keyboard') letter `x` may be typed, or the actual unicode character may be used. Similarly for Greek letters. The upright or italic forms are then chosen based on the `math-style` package option.

If glyphs are desired that do not map as per the package option (for example, an upright ' $g$ ' is desired but typing `$g$` yields ' $g$ '), *markup* is required to specify this; to follow from the example: `\mathup{g}`. Maths alphabets commands such as `\mathup` are detailed later.

Table 3: Effects of the `math-style` package option.

Package option	Example	
	Latin	Greek
<code>math-style=ISO</code>	$(a, z, B, X)$	$(\alpha, \beta, \Gamma, \Xi)$
<code>math-style=TeX</code>	$(a, z, B, X)$	$(\alpha, \beta, \Gamma, \Xi)$
<code>math-style=French</code>	$(a, z, B, X)$	$(\alpha, \beta, \Gamma, \Xi)$
<code>math-style=upright</code>	$(a, z, B, X)$	$(\alpha, \beta, \Gamma, \Xi)$

**Alternative interface** However, some users may not like this convention of normalising their input. For them, an upright  $x$  is an upright ‘ $x$ ’ and that’s that. (This will be the case when obtaining source text from copy/pasting PDF or Microsoft Word documents, for example.) For these users, the `literal` option to `math-style` will effect this behaviour.

The `math-style` options’ effects are shown in brief in table 3.

## 5.2 Bold style

Similar as in the previous section, ISO standards differ somewhat to  $\text{\TeX}$ ’s conventions (and classical typesetting) for ‘boldness’ in mathematics. In the past, it has been customary to use bold *upright* letters to denote things like vectors and matrices. For example,  $\mathbf{M} = (M_x, M_y, M_z)$ . Presumably, this was due to the relatively scarcity of bold italic fonts in the pre-digital typesetting era. It has been suggested that *italic* bold symbols are used nowadays instead.

Bold Greek letters have simply been bold variant glyphs of their regular weight, as in  $\xi = (\xi_r, \xi_\varphi, \xi_\theta)$ . Confusingly, the syntax in  $\text{\LaTeX}$  has been different for these two examples: `\mathbf{f}` in the former (‘ $\mathbf{M}$ ’), and `\bm` (or `\boldsymbol`, deprecated) in the latter (‘ $\xi$ ’).

In `unicode-math`, the `\mathbf{f}` command works directly with both Greek and Latin maths alphabet characters and depending on package option either switches to upright for Latin letters (`bold-style=TeX`) as well or keeps them italic (`bold-style=ISO`).

To match the package options for non-bold characters, for `bold-style=upright` all bold characters are upright, and `bold-style=literal` does not change the upright/italic shape of the letter.

Upright and italic bold mathematical letters input as direct unicode characters are normalised with the same rules. For example, with `bold-style=TeX`, a literal bold italic latin character will be typeset upright.

Note that `bold-style` is independent of `math-style`, although if the former is not specified then sensible defaults are chosen based on the latter.

The `bold-style` options’ effects are shown in brief in table 4.

Table 4: Effects of the `bold-style` package option.

Package option	Example	
	Latin	Greek
<code>bold-style=ISO</code>	$(\boldsymbol{a}, \boldsymbol{z}, \boldsymbol{B}, \boldsymbol{X})$	$(\boldsymbol{\alpha}, \boldsymbol{\beta}, \boldsymbol{\Gamma}, \boldsymbol{\Xi})$
<code>bold-style=TeX</code>	$(\boldsymbol{a}, \boldsymbol{z}, \boldsymbol{B}, \boldsymbol{X})$	$(\boldsymbol{\alpha}, \boldsymbol{\beta}, \boldsymbol{\Gamma}, \boldsymbol{\Xi})$
<code>bold-style=upright</code>	$(\boldsymbol{a}, \boldsymbol{z}, \boldsymbol{B}, \boldsymbol{X})$	$(\boldsymbol{\alpha}, \boldsymbol{\beta}, \boldsymbol{\Gamma}, \boldsymbol{\Xi})$

### 5.3 Sans serif style

Unicode contains upright and italic, medium and bold mathematical alphabet characters. These may be explicitly selected with the `\mathsfup`, `\mathsfit`, `\mathbfsup`, and `\mathbfsfit` commands discussed in section §5.4.

How should the generic `\mathsf` behave? Unlike bold, sans serif is used much more sparingly in mathematics. I’ve seen recommendations to typeset tensors in sans serif italic or sans serif italic bold (e.g., examples in the `isomath` and `mattens` packages). But L<sup>A</sup>T<sub>E</sub>X’s `\mathsf` is *upright* sans serif.

Therefore I reluctantly add the package options `[sans-style=upright]` and `[sans-style=italic]` to control the behaviour of `\mathsf`. The `upright` style sets up the command to use the seemingly-useless upright sans serif, including Greek; the `italic` style switches to using italic in both Latin and Greek alphabets. In other words, this option simply changes the meaning of `\mathsf` to either `\mathsfup` or `\mathsfit`, respectively. Please let me know if more granular control is necessary here.

There is also a `[sans-style=literal]` setting, set automatically with `[math-style=literal]`, which retains the uprightness of the input characters used when selecting the sans serif output.

#### 5.3.1 What about bold sans serif?

While you might want your bold upright and your sans serif italic, I don’t believe you’d also want your bold sans serif upright (or all vice versa, if that’s even conceivable). Therefore, bold sans serif follows from the setting for sans serif; it is completely independent of the setting for bold.

In other words, `\mathbfsf` is `\mathbfsup` or `\mathbfsfit` based on `[sans-style=upright]` or `[sans-style=italic]`, respectively. And `[sans-style=literal]` causes `\mathbfsf` to retain the same italic or upright shape as the input, and turns it bold sans serif.

Note well! There is no medium-weight sans serif Greek alphabet in unicode; therefore, `\mathsf{\alpha}` does not make sense (simply produces ‘ $\alpha$ ’) while `\mathbfsf{\alpha}` gives ‘ $\alpha$ ’.

Table 5: Mathematical alphabets defined in unicode. Black dots indicate an alphabet exists in the font specified; grey dots indicate shapes that should always be taken from the upright font even in the italic style. See main text for description of `\mathbbit`.

Font				Alphabet		
Style	Shape	Series	Switch	Latin	Greek	Numerals
Serif	Upright	Normal	<code>\mathup</code>	•	•	•
		Bold	<code>\mathbfup</code>	•	•	•
	Italic	Normal	<code>\mathit</code>	•	•	•
		Bold	<code>\mathbfit</code>	•	•	•
Sans serif	Upright	Normal	<code>\mathsfup</code>	•		•
	Italic	Normal	<code>\mathsfit</code>	•		•
	Upright	Bold	<code>\mathsfbfup</code>	•	•	•
	Italic	Bold	<code>\mathsfbfit</code>	•	•	•
Typewriter	Upright	Normal	<code>\mathtt</code>	•		•
Double-struck	Upright	Normal	<code>\mathbb</code>	•		•
	Italic	Normal	<code>\mathbbit</code>	•		
Script	Upright	Normal	<code>\mathscr</code>	•		
		Bold	<code>\matbfscr</code>	•		
Fraktur	Upright	Normal	<code>\mathfrak</code>	•		
		Bold	<code>\mathbffrac</code>	•		

## 5.4 All (the rest) of the mathematical alphabets

Unicode contains separate codepoints for most if not all variations of alphabet shape one may wish to use in mathematical notation. The complete list is shown in table 5. Some of these have been covered in the previous sections.

At present, the math font switching commands do not nest; therefore if you want sans serif bold, you must write `\mathsfbf{...}` rather than `\mathbf{\mathsf{...}}`. This may change in the future.

### 5.4.1 Double-struck

The double-struck alphabet (also known as ‘blackboard bold’) consists of upright Latin letters  $\{a-z, A-Z\}$ , numerals  $\{0-9\}$ , summation symbol  $\Sigma$ , and four Greek letters only:  $\{\gamma, \Omega, \Gamma, \Pi\}$ .

While `\mathbb{\sum}` does produce a double-struck summation symbol, its limits aren’t properly aligned (see section §??). Therefore, either the literal character or the control sequence `\Bbbsum` are recommended instead.

There are also five Latin *italic* double-struck letters:  $\mathbb{D}, \mathbb{d}, \mathbb{E}, \mathbb{e}, \mathbb{J}$ . These can be accessed (if not with their literal characters or control sequences) with the `\mathbbit`

Table 6: The various forms of nabla.

Description		Glyph
Upright	Serif	$\nabla$
	Bold serif	<b><math>\nabla</math></b>
	Bold sans	<b><math>\nabla</math></b>
Italic	Serif	$\nabla$
	Bold serif	<b><math>\nabla</math></b>
	Bold sans	<b><math>\nabla</math></b>

alphabet switch, but note that only those five letters will give the expected output.

## 5.5 Miscellanea

### 5.5.1 Nabla

The symbol  $\nabla$  comes in the six forms shown in table 6. We want an individual option to specify whether we want upright or italic nabla by default (when either upright or italic nabla is used in the source).  $\text{\TeX}$  classically uses an upright nabla, but iso standards differ (I think). The package options `nabla=upright` and `nabla=italic` switch between the two choices. This is then inherited through `\mathbf`; `\mathit` and `\mathup` can be used to force one way or the other.

`nabla=italic` is implicit when using `math-style=ISO` and `nabla=upright` follows both `math-style=TeX` and `math-style=French`.

### 5.5.2 Partial

The same applies to the symbols U+2202: PARTIAL DIFFERENTIAL and U+1D715: MATH ITALIC PARTIAL DIFFERENTIAL.

At time of writing, both the Cambria Math and STIX fonts display these two glyphs in the same italic style, but this is hopefully a bug that will be corrected in the future — the ‘plain’ partial differential should really have an upright shape.

Use the `partial=upright` or `partial=italic` package options to specify which one you would like. The default is (always, unless someone requests and argues otherwise) `partial=italic`.<sup>1</sup>

See table 7 for the variations on the partial differential symbol.

<sup>1</sup>A good argument would revolve around some international standards body recommending upright over italic. I just don’t have the time right now to look it up.

Table 7: The various forms of the partial differential. Note that in the fonts used to display these glyphs, the first upright partial is incorrectly shown in an italic style.

Description		Glyph
Regular	Upright	$\partial$
	Italic	$\partial$
Bold	Upright	<b><math>\partial</math></b>
	Italic	<b><math>\partial</math></b>
Sans bold	Upright	$\partial$
	Italic	$\partial$

### 5.5.3 Epsilon and phi: $\varepsilon$ vs. $\epsilon$ and $\varphi$ vs. $\phi$

TeX defines `\epsilon` to look like  $\epsilon$  and `\varepsilon` to look like  $\varepsilon$ . The Unicode glyph directly after delta and before zeta is ‘epsilon’ and looks like  $\varepsilon$ ; there is a subsequent variant of epsilon that looks like  $\epsilon$ . This creates a problem. People who use unicode input won’t want their glyphs transforming; TeX users will be confused that what they think as ‘normal epsilon’ is actual the ‘variant epsilon’. And the same problem exists for ‘phi’.

We have a package option to control this behaviour. With `\vargreek-shape=TeX`, `\phi` and `\epsilon` produce  $\phi$  and  $\varepsilon$  and `\varphi` and `\varepsilon` produce  $\phi$  and  $\epsilon$ . With `\vargreek-shape=unicode`, these symbols are swapped. Note, however, that unicode characters are not affected by this option. That is, no remapping occurs of the characters/glyphs, only the control sequences.

The package default is to use `\vargreek-shape=TeX`.

U+3B5: GREEK SMALL LETTER EPSILON

U+3F5: GREEK LUNATE EPSILON SYMBOL

U+3C6: GREEK SMALL LETTER PHI

U+3D5: GREEK SMALL LETTER SCRIPT PHI

### 5.5.4 Primes

Primes ( $x'$ ) may be input in several ways. You may use any combination of ascii straight quote (‘), unicode prime (’), and `\prime`; when multiple primes occur next to each other, they chain together to form double, triple, or quadruple primes if the font contains pre-drawn glyphs. These may also be accessed with `\primedouble`, `\primetripel`, and `\primequadruple`.

If the font does not contain the pre-drawn glyphs or more than four primes are used, the single prime glyph is used multiple times with a negative kern to get the spacing right. There is no user interface to adjust this negative kern yet (because I haven’t decided what it should look like); if you need to, write something

A 0 1 2 3 4 5 6 7 8 9 + - = ( ) i n Z

Figure 1: The unicode superscripts supported as input characters. These are the literal glyphs from Charis SIL, not the output seen when used for maths input. The ‘A’ and ‘Z’ are to provide context for the size and location of the superscript glyphs.

A 0 1 2 3 4 5 6 7 8 9 + - = ( ) a e i o r u v x β γ ρ ϕ χ Z

Figure 2: The unicode subscripts supported as input characters. See note from figure 1.

like this:

```
\ExplSyntaxOn
\muskip_gset:Nn \g_um_primekern_muskip { -\thinmuskip/2 }
\ExplSyntaxOff
```

### 5.5.5 Unicode subscripts and superscripts

You may, if you wish, use unicode subscripts and superscripts in your source document. For basic expressions, the use of these characters can make the input more readable. Adjacent sub- or super-scripts will be concatenated into a single expression.

The range of subscripts and superscripts supported by this package are shown in figures 1 and 2. Please request more if you think it is appropriate.

### 5.5.6 Colon

The colon is one of the few confusing characters of unicode maths. In  $\text{\TeX}$ , `:` is defined as a colon with relation spacing: ‘ $a : b$ ’. While `\colon` is defined as a colon with punctuation spacing: ‘ $a:b$ ’.

In unicode, `U+003A: COLON` is defined as a punctuation symbol, while `U+2236: RATIO` is the colon-like symbol used in mathematics to denote ratios and other things.

This breaks the usual straightforward mapping from control sequence to unicode input character to (the same) unicode glyph.

To preserve input compatibility, we remap the `ASCII` input character ‘`:`’ to `U+2236: RATIO`. Typing a literal `U+2236: RATIO` char will result in the same output. If `amsmath` is loaded, then the definition of `\colon` is inherited from there (it looks like a punctuation colon with additional space around it). Otherwise, `\colon` is made to output a colon with `\mathpunct` spacing.

Table 8: Slashes and backslashes.

Slot	Name	Glyph	Command
U+002F	SOLIDUS	/	<code>\solidus</code>
U+2044	FRACTION SLASH	/	<code>\fracslash</code>
U+2215	DIVISION SLASH	/	<code>\slash</code>
U+29F8	BIG SOLIDUS	/	<code>\xsol</code>
U+005C	REVERSE SOLIDUS	\	<code>\backslash</code>
U+2216	SET MINUS	\	<code>\smallsetminus</code>
U+29F5	REVERSE SOLIDUS OPERATOR	\	<code>\setminus</code>
U+29F9	BIG REVERSE SOLIDUS	\	<code>\xbsol</code>

The package option `[colon=literal]` forces ASCII input ‘:’ to be printed as `\mathcolon` instead.

### 5.5.7 Slashes and backslashes

There are several slash-like symbols defined in unicode. The complete list is shown in table 8.

In regular L<sup>A</sup>T<sub>E</sub>X we can write `\left\slash...\right\backslash` and so on and obtain extensible delimiter-like symbols. Not all of the unicode slashes are suitable for this (and do not have the font support to do it).

**Slash** Of U+2044: FRACTION SLASH, TR25 says that it is:

...used to build up simple fractions in running text...however parsers of mathematical texts should be prepared to handle fraction slash when it is received from other sources.

U+2215: DIVISION SLASH should be used when division is represented without a built-up fraction;  $\pi \approx 22/7$ , for example.

U+29F8: BIG SOLIDUS is a ‘big operator’ (like  $\Sigma$ ).

**Backslash** The U+005C: REVERSE SOLIDUS character `\backslash` is used for denoting double cosets:  $A \backslash B$ . (So I’m led to believe.) It may be used as a ‘stretchy’ delimiter if supported by the font.

MathML uses U+2216: SET MINUS like this:  $A \setminus B$ .<sup>2</sup> The L<sup>A</sup>T<sub>E</sub>X command name `\smallsetminus` is used for backwards compatibility.

<sup>2</sup>§4.4.5.11 <http://www.w3.org/TR/2001/REC-MathML-20010816/>

Presumably, U+29F5: REVERSE SOLIDUS OPERATOR is intended to be used in a similar way, but it could also (perhaps?) be used to represent ‘inverse division’:  $\pi \approx 7 \setminus 22$ .<sup>3</sup> The L<sup>A</sup>T<sub>E</sub>X name for this character is `\setminus`.

Finally, U+29F9: BIG REVERSE SOLIDUS is a ‘big operator’ (like  $\Sigma$ ).

**How to use all of these things** Unfortunately, font support for the above characters/glyphs is rather inconsistent. In Cambria Math, the only slash that grows (say when writing

$$\left[ \begin{array}{cc} a & b \\ c & d \end{array} \right] / \left[ \begin{array}{cc} 1 & 1 \\ 1 & 0 \end{array} \right] )$$

is the FRACTION SLASH, which we just established above is sort of only supposed to be used in text.

Of the above characters, the following are allowed to be used after `\left`, `\middle`, and `\right`:

- `\solidus`;
- `\fracslash`;
- `\slash`; and,
- `\backslash` (the only reverse slash).

However, we assume that there is only *one* stretchy slash in the font; this is assumed by default to be U+002F: SOLIDUS. Writing `\left/` or `\left\slash` or `\leftfracslash` will all result in the same stretchy delimiter being used.

The delimiter used can be changed with the `slash-delimiter` package option. Allowed values are `ascii`, `frac`, and `div`, corresponding to the respective unicode slots.

For example: as mentioned above, Cambria Math’s stretchy slash is U+2044: FRACTION SLASH. When using Cambria Math, then `unicode-math` should be loaded with the `[slash-delimiter=frac]` option. (This should be a font option rather than a package option, but it will change soon.)

### 5.5.8 Normalising some input characters

I believe all variant forms should be used as legal input that is normalised to a consistent output glyph, because we want to be fault-tolerant in the input. Here are the duplicates:

U+2511: LATIN SMALL LETTER ALPHA

U+25B: LATIN SMALL LETTER EPSILON

---

<sup>3</sup>This is valid syntax in the Octave and Matlab programming languages, in which it means matrix inverse pre-multiplication. I.e.,  $A \setminus B \equiv A^{-1}B$ .

U+263: LATIN SMALL LETTER GAMMA  
 U+269: LATIN SMALL LETTER IOTA  
 U+278: LATIN SMALL LETTER PHI  
 U+28A: LATIN SMALL LETTER UPSILON  
 U+190: LATIN CAPITAL LETTER EPSILON  
 U+194: LATIN CAPITAL LETTER GAMMA  
 U+196: LATIN CAPITAL LETTER IOTA  
 U+1B1: LATIN CAPITAL LETTER UPSILON

(Not yet implemented.)

## File I

# The unicode-math package

This is the package.

```
1 \ProvidesPackage{unicode-math}
2 [2009/10/02 v0.4 Unicode maths in XeLaTeX]
```

## 6 Things we need

### Packages

```
3 \RequirePackage{expl3}[2009/08/12]
4 \RequirePackage{xparse}[2009/08/31]
5 \RequirePackage{fontspec}
   Start using LATEX3 — finally!
6 \ExplSyntaxOn
```

### Counters and conditionals

```
7 \newcounter{um@fam}
8 \newif\if@um@fontspec@feature
9 \newif\if@um@ot@math@
10 \bool_new:N \l_um_init_bool
```

For math-style:

```
11 \newif\if@um@literal
12 \newif\if@um@upGreek
13 \newif\if@um@upgreek
14 \newif\if@um@upLatin
15 \newif\if@um@uplatin
```

For bold-style:

```
16 \newif\if@um@bfliteral
17 \newif\if@um@bfupGreek
18 \newif\if@um@bfupgreek
19 \newif\if@um@bfupLatin
20 \newif\if@um@bfuplatin
```

For nabla:

```
21 \newif\if@um@upNabla
22 \newif\if@um@uppartial
23 \bool_new:N \g_um_texgreek_bool
```

### 6.0.9 Alphabet unicode positions

Before we begin, let's define the positions of the various unicode alphabets so that our code is a little more readable.<sup>4</sup>

```
24 \def\um@usv@num{\0}
25 \def\um@usv@upLatin{\A}
26 \def\um@usv@uplatin{\a}
27 \def\um@usv@upGreek{"391}
28 \def\um@usv@upgreek{"3B1}
29 \def\um@usv@itLatin{"1D434}
30 \def\um@usv@itlatin{"1D44E}
31 \def\um@usv@itGreek{"1D6E2}
32 \def\um@usv@itgreek{"1D6FC}
33 \def\um@usv@bbnum{"1D7D8}
34 \def\um@usv@bbLatin{"1D538}
35 \def\um@usv@bblatin{"1D552}
36 \def\um@usv@scrLatin{"1D49C}
37 \def\um@usv@scrlatin{"1D4B6}
38 \def\um@usv@frakLatin{"1D504}

## 6.1 Package options

xkeyval's package support is used here. I'll switch over to l3keys2e at some stage.

`\unimathsetup` This macro can be used in lieu of or later to override options declared when the package is loaded.

```
133 \DeclareDocumentCommand \unimathsetup {m} {  
134   \setkeys{unicode-math.sty}{#1}  
135 }
```

### math-style

```
136 \define@choicekey*{unicode-math.sty}  
137   {math-style}[\@tempa\@tempb]{iso,tex,french,upright,literal}{

366 \tl_remove_in:Nn \@preamblecmds {\do#1}
367 }

```

### 6.3 Other things

`\um@fontdimen@percent` #1 : Font dimen number

`\fontdimens 10`, `11`, and `65` aren't actually dimensions, they're percentage values given in units of sp. This macro takes a font dimension number and outputs the decimal value of the associated parameter.

---

0.73  
0.60  
0.65

---

```

\font\tmpfont="Cambria Math"
\um@fontdimen@percent{10}{\tmpfont}
\um@fontdimen@percent{11}{\tmpfont}
\um@fontdimen@percent{65}{\tmpfont}

```

---

```

368 \def\um@fontdimen@percent#1#2{
369   0.\strip@pt\dimexpr\fontdimen#1#2 *65536\relax
370 }

\um@scaled@apply #1 : A math style
                  #2 : Macro that takes a non-delimited length argument (like \kern)
                  #3 : Length control sequence to be scaled according to the math style
This macro is used to scale the lengths reported by \fontdimen according to the
scale factor for script- and scriptscript-size objects.

371 \def\um@scaled@apply#1#2#3{
372   \ifx#1\scriptstyle
373     #2\um@fontdimen@percent{10}\um@font#3
374   \else
375     \ifx#1\scriptscriptstyle
376       #2\um@fontdimen@percent{11}\um@font#3
377     \else
378       #2#3%
379     \fi
380   \fi
381 }

```

## 7 Fundamentals

### 7.1 Enlarging the number of maths families

To start with, we've got a power of two as many \fams as before. So (from `ltxssbas.dtx`) we want to redefine

```

382 \def\new@mathgroup{\alloc@8\mathgroup\chardef\@cclvi}
383 \let\newfam\new@mathgroup

```

This is sufficient for L<sup>A</sup>T<sub>E</sub>X's \DeclareSymbolFont-type commands to be able to define 256 named maths fonts. Now we need a new \DeclareMathSymbol.

### 7.2 \DeclareMathSymbol for unicode ranges

This command is a bit funny at the moment; it doesn't define the actual macro for almost all of the symbols passed to it, but it does assign the \XeTeXmathchar.

```

\um@mathsymbol #1 : Symbol, e.g., \alpha
                #2 : Type, e.g., \mathalpha
                #3 : Math font name, e.g., operators
                #4 : Slot, e.g., "221E

384 \def \um@mathsymbol#1#2#3#4{
385   \expandafter\um@set@mathsymbol\csname sym#3\endcsname#1#2{#4}}

```

The final macros that actually define the maths symbol with XeTeX primitives.

```
\um@set@mathsymbol #1 : Symbol font number
#2 : Symbol macro, e.g., \alpha
#3 : Type, e.g., \mathalpha
#4 : Slot, e.g., "221E
If the symbol definition is for a macro. There are a bunch of tests to perform to
process the various characters.
386 \def\um@set@mathsymbol#1#2#3#4{
```

**Operators** In the examples following, say we’re defining for the symbol  $\sum(\Sigma)$ .

```
387 \ifx\mathop#3\relax
```

In order for literal unicode characters to be used in the source and still have the correct limits behaviour, big operators are made math-active.

The active math char is defined to expand to the macro `\sumop`.

```
388 \begingroup
389 \char_make_active:n {#4}
390 \global\mathcode#4="8000\relax
391 \um@scanactivedef #4 \@nil { \csname\cs_to_str:N #2 op\endcsname }
392 \endgroup
```

Some of these require a `\nolimits` suffix. This is controlled by the `\um@nolimits` macro, which contains a list of such characters. This list is checked dynamically because we’re not interested in efficiency. Or something. This allows the list to be updated in the middle of a document.

Declare the plain old `\mathchardef` for the control sequence `\sum@sym`.

```
393 \expandafter\global\expandafter\XeTeXmathchardef
394 \csname\string#2@sym\endcsname
395 =" \mathchar@type#3 #1 #4\relax
```

Now define `\sumop` as `\sum@sym`, followed by `\nolimits` if necessary.

```
396 \cs_gset:cpn { \cs_to_str:N #2 op } {
397 \csname\string#2@sym\endcsname
398 \expandafter\in@\expandafter#2\expandafter{\um@nolimits}
399 \ifin@
400 \expandafter\nolimits
401 \fi
402 }
```

Don’t forget that the actual `\sum` macro is simply defined in terms of the literal unicode symbol!

```
403 \else
```

**Radicals** Needs to be before the delimiters because the radical is, for some reason, `\mathopen`.

```

404 \expandafter\in@\expandafter#2\expandafter{\um@radicals,}
405 \ifin@
406 \cs_gset:cpn {\cs_to_str:N #2 sign} { \XeTeXradical #1 #4 \relax }
407 \else

```

**Delimiters** TODO: sort out which of these three declarations are necessary! (Definitely the first, to work with `\left/\right.`.)

```

408 \ifx\mathopen#3\relax
409 \cs_gset:Npn #2 {\XeTeXdelimiter "\mathchar@type#3 #1 #4\relax}
410 \global\XeTeXdelcode#4=#1 #4\relax
411 \global\XeTeXmathcode#4="\mathchar@type#3 #1 #4\relax
412 \else
413 \ifx\mathclose#3\relax
414 \cs_gset:Npn #2 {\XeTeXdelimiter "\mathchar@type#3 #1 #4\relax}
415 \global\XeTeXdelcode#4=#1 #4\relax
416 \global\XeTeXmathcode#4="\mathchar@type#3 #1 #4\relax
417 \else

```

### Accents

```

418 \ifx\mathaccent#3\relax
419 \cs_gset:Npx #2 {\XeTeXmathaccent "\mathchar@type#3 #1 #4\relax}
420 \else

```

And finally, the general case. We define the unicode mathcode for the character. The macro is defined generically in terms of the unicode character.

```

421 \global\XeTeXmathcode#4="\mathchar@type#3 #1 #4\relax
422 \fi
423 \fi
424 \fi
425 \fi
426 \fi
427 }

```

`\um_set_mathcode:nnnn` [For later] or if it's for a character code (just a wrapper around the primitive). Note that this declaration *isn't* global so that it can be constrained by grouping inside math alphabet switches.

```

428 \cs_set:Nn \um_set_mathcode:nnnn {
429 \XeTeXmathcode#1="\mathchar@type#2 \csname sym#3\endcsname #4\relax
430 }

```

### 7.3 The main `\setmathfont` macro

Using a range including large character sets such as `\mathrel`, `\mathalpha`, *etc.*, is *very slow*! I hope to improve the performance somehow.

`\setmathfont` [#1]: font features

#2 : font name

```
431 \DeclareDocumentCommand \setmathfont { O{ } m } {
```

- Erase any conception L<sup>A</sup>T<sub>E</sub>X has of previously defined math symbol fonts; this allows `\DeclareSymbolFont` at any point in the document.

```
432     \let\glb@currsizel\relax
```

- To start with, assume we’re defining the font for every math symbol character.

```
433     \bool_set_true:N \l_um_init_bool
```

```
434     \seq_clear:N \l_um_char_range_seq
```

```
435     \let\um@char@num@range\empty
```

- Tell fontspec that maths font features are actually allowed.

```
436     \@um@fontspec@featuretrue
```

- Grab the current size information (is this robust enough? Maybe it should be preceded by `\normalsize`).

```
437     \csname S@\f@size\endcsname
```

- Set the name of the math version being defined. (obviously more needs to be done here!)

```
438     \def\um@mversion{normal}
```

```
439     \DeclareMathVersion{\um@mversion}
```

Define default font features for the script and scriptscript font. (This needs to be generalised so users can override it.)

```
440     \tl_set:Nn \l_um_script_features_tl {ScriptStyle}
```

```
441     \tl_set:Nn \l_um_sscript_features_tl {ScriptScriptStyle}
```

```
442     \tl_set:Nn \l_um_script_font_tl {#2}
```

```
443     \tl_set:Nn \l_um_sscript_font_tl {#2}
```

Use fontspec to select a font to use. The macro `\S@{size}` contains the definitions of the sizes used for maths letters, subscripts and subsubscripts in `\tf@size`, `\sf@size`, and `\ssf@size`, respectively.

```
444     \setkeys*{unicode-math.sty}{#1}
```

```

445 \cs_set:Npx \um_tmp: {
446   \exp_not:N \setkeys*[um]{options}{\exp_not:V \XKV@rm}
447 }
448 \um_tmp:
449 \edef\@tempa{\noexpand\zf@fontspec{
450   Script = Math,
451   SizeFeatures = {
452     {Size = \tf@size-} ,
453     {Size = \sf@size-\tf@size ,
454       Font = \l_um_script_font_tl ,
455       \l_um_script_features_tl
456     } ,
457     {Size = -\sf@size ,
458       Font = \l_um_sscript_font_tl ,
459       \l_um_sscript_features_tl
460     }
461   },
462   \XKV@rm
463 }{#2}
464 }
465 \@tempa

```

Probably want to check there that we're not creating multiple symbol fonts with the same NFSS declaration.

Check for the correct number of `\fontdimens`:

```

466 \font\um@font="#2"\relax
467 %% \ifdim \dimexpr\fontdimen9\um@font*65536\relax =65pt\relax
468 %% \@um@ot@math@true
469 %% \else
470 %% \PackageWarningNoLine{unicode-math}{
471 %%   The~ font~ '#2' ~is~ not~ a~ valid~ OpenType~ maths~ font.~
472 %%   Some~ maths~ features~ will~ not~ be~ available~ or~ behave~
473 %%   in~ a~ substandard~ manner
474 %% }
475 %% \fi

```

If we're defining the full unicode math repertoire, then we skip all the parsing processing needed if we're only defining a subset.

- Math symbols are defined with `\UnicodeMathSymbol`; see section §7.3.1 for the individual definitions

```

476 \bool_if:NTF \l_um_init_bool {
477   \tl_set:Nn \um_symfont_tl {um@allsym}
478   \PackageInfo{unicode-math}{Defining~ the~ default~ maths~ font~ as~ '#2'}
479   \cs_set_eq:NN \UnicodeMathSymbol \um_process_symbol_noparse:nnnn
480   \cs_set_eq:NN \um_mathmap:Nnn \um_mathmap_noparse:Nnn
481   \cs_set_eq:NN \um_remap_symbol:nnn \um_remap_symbol_noparse:nnn

```

```

482 \cs_set_eq:NN \um_maybe_init_alphabet:n \um_init_alphabet:n
483 }{
484 \stepcounter{um@fam}
485 \tl_set:Nx \um_symfont_tl {um@fam\theum@fam}
486 \cs_set_eq:NN \UnicodeMathSymbol \um_process_symbol_parse:nnnn
487 \cs_set_eq:NN \um_mathmap:Nnn \um_mathmap_parse:Nnn
488 \cs_set_eq:NN \um_remap_symbol:nnn \um_remap_symbol_parse:nnn
489 \cs_set_eq:NN \um_maybe_init_alphabet:n \use_none:n
490 }

```

Now defined `\um_symfont_tl` as the  $\text{\LaTeX}$  math font to access everything:

```

491 \DeclareSymbolFont{\um_symfont_tl}
492 {\encodingdefault}{\zf@family}{\mddefault}{\updefault}

```

And now we input every single maths char. See File II for the source to `unicode-math.tex` which is used to create `unicode-math-table.tex`.

```

493 \@input{unicode-math-table.tex}

```

Finally,

- Set up shapes for italic/upright or ordinary/var symbols as per package options.
- Remap symbols that don't take their natural mathcode
- Activate any symbols that need to be math-active
- Setup all symbols not covered by the table (mostly alphanumerics)
- Setup the maths alphabets (`\mathbf` etc.)

```

494 \um_setup_shapes:
495 \um_remap_symbols:
496 \um_setup_mathactives:
497 \um_setup_delcodes:
498 \um_setup_alphanum:
499 \um_setup_alphabets:

```

End of the `\setmathfont` macro.

```

500 }

501 \cs_new:Nn \um_setup_shapes: {
502 \um_setup_nabla:
503 \um_setup_partial:
504 \um_setup_sfshapes:
505 \um_setup_bfshapes:
506 }

```

### 7.3.1 Functions for setting up symbols with mathcodes

`\um_process_symbol_noparse:nnnn` If the range font feature has been used, then only a subset of the unicode glyphs  
`\um_process_symbol_parse:nnnn` are to be defined. See section §8.3 for the code that enables this.

```

507 \cs_set:Nn \um_process_symbol_noparse:nnnn {
508   \um@mathsymbol{#2}{#3}{\um_symfont_t1}{#1}
509 }

510 \cs_set:Nn \um_process_symbol_parse:nnnn {
511   \um@parse@term{#1}{#2}{#3}{
512     \um_process_symbol_noparse:nnnn{#1}{#2}{#3}{#4}
513   }
514 }
```

`\um_remap_symbols:` This function is used to define the mathcodes for those chars which should be  
`\um_remap_symbol_noparse:nnn` mapped to a different glyph than themselves.  
`\um_remap_symbol_parse:nnnn`

```

515 \cs_new:Nn \um_remap_symbols: {
516   \um_remap_symbol:nnn{`-}{\mathbin}{"02212}% hyphen to minus
517   \um_remap_symbol:nnn{`*}{\mathbin}{"02217}% text asterisk to "cen-
    tred asterisk"
518   \bool_if:NF \g_um_literal_colon_bool {
519     \um_remap_symbol:nnn{`\:}{\mathrel}{"02236}% colon to ratio (i.e., punct to rel)
520   }
521   \if@um@literal
522     \um_remap_symbol:nnn {\um@usv@Nabla}{\mathord}{\um@usv@Nabla}
523     \um_remap_symbol:nnn {\um@usv@itNabla}{\mathord}{\um@usv@itNabla}
524     \um_remap_symbol:nnn {\um@usv@partial}{\mathord}{\um@usv@partial}
525     \um_remap_symbol:nnn {\um@usv@itpartial}{\mathord}{\um@usv@itpartial}
526   \else
527     \um_remap_symbol:nnn {\um@usv@Nabla,\um@usv@itNabla}{\mathord}{\um_Nabla_up_or_it_usv}
528     \um_remap_symbol:nnn {\um@usv@partial,\um@usv@itpartial}{\mathord}{\um_partial_up_or_it_usv}
529   \fi
```

Some of these in the `bfliteral` block may be redundant, but that's okay:

```

530 \if@um@bfliteral
531   \um_remap_symbol:nnn {\um@usv@bfNabla}{\mathord}{\um@usv@bfNabla}
532   \um_remap_symbol:nnn {\um@usv@bfitNabla}{\mathord}{\um@usv@bfitNabla}
533   \um_remap_symbol:nnn {\um@usv@bfsfNabla}{\mathord}{\um@usv@bfsfNabla}
534   \um_remap_symbol:nnn {\um@usv@bfsfitNabla}{\mathord}{\um@usv@bfsfitNabla}
535   \um_remap_symbol:nnn {\um@usv@bfpartial}{\mathord}{\um@usv@bfpartial}
536   \um_remap_symbol:nnn {\um@usv@bfitpartial}{\mathord}{\um@usv@bfitpartial}
537   \um_remap_symbol:nnn {\um@usv@bfsfpartial}{\mathord}{\um@usv@bfsfpartial}
538   \um_remap_symbol:nnn {\um@usv@bfsfitpartial}{\mathord}{\um@usv@bfsfitpartial}
539 \else
540   \um_remap_symbol:nnn {\um@usv@bfNabla,\um@usv@bfitNabla}{\mathord}{\um_bfNabla_up_or_it_usv}
541   \um_remap_symbol:nnn {\um@usv@bfsfNabla,\um@usv@bfsfitNabla}{\mathord}{\um_bfsfNabla_up_or_it_usv}
542   \um_remap_symbol:nnn {\um@usv@bfpartial,\um@usv@bfitpartial}{\mathord}{\um_bfpartial_up_or_it_usv}
```

```

543 \um_remap_symbol:nnn {\um@usv@bfsfpartial,\um@usv@bfsfitpartial}{\mathord}{\um_bfsfpartia
544 \fi
545 }

```

Where `\um_remap_symbol:nnn` is defined to be one of these two, depending on the range setup:

```

546 \cs_new:Nn \um_remap_symbol_parse:nnn {
547   \um@parse@term {#3} {\@nil} {#2} {
548     \um_remap_symbol_noparse:nnn {#1} {#2} {#3}
549   }
550 }
551 \cs_new:Nn \um_remap_symbol_noparse:nnn {
552   \clist_map_inline:nn {#1} {
553     \um_set_mathcode:nnnn {##1} {#2} {\um_symfont_tl} {#3}
554   }
555 }

```

### 7.3.2 Active math characters

There are more math active chars later in the subscript/superscript section. But they don't need to be able to be typeset directly.

`\um_setup_mathactives:`

```

556 \cs_new:Nn \um_setup_mathactives: {
557   \um_make_mathactive:nnn {"2032} \primesingle \mathord
558 }

```

`\um_make_mathactive:nnn` : TODO : hook into range feature Makes #1 a mathactive char, and gives cs #2 the meaning of mathchar #1 with class #3. You are responsible for giving active #1 a particular meaning!

```

559 \cs_new:Nn \um_make_mathactive:nnn {
560   \XeTeXmathchardef #2 = "\mathchar@type #3
561                           \csname sym\um_symfont_tl\endcsname
562                           #1 \scan_stop:
563   \XeTeXmathcodenum #1 = "1FFFFF \scan_stop:
564 }

```

### 7.3.3 Delimiter codes

Some symbols that aren't `\mathopen`/`\mathclose` still need to have delimiter codes assigned. The list of vertical arrows may be incomplete. On the other hand, many fonts won't support them all being stretchy.

`\um_setup_delcodes:`

```

565 \cs_new:Nn \um_setup_delcodes: {
566   \um_set_delcode:nn {\`\/} {\g_um_slash_delimiter_usv}

```

```

567 \um_set_delcode:nn {"2044} {\g_um_slash_delimiter_usv} % fracslash
568 \um_set_delcode:nn {"2215} {\g_um_slash_delimiter_usv} % divslash
569 \um_set_delcode:n {"005C} % backslash
570 \um_set_delcode:nn {"\<} {"27E8} % angle brackets with ascii notation
571 \um_set_delcode:nn {"\>} {"27E9} % angle brackets with ascii notation
572 \um_set_delcode:n {"2191} % up arrow
573 \um_set_delcode:n {"2193} % down arrow
574 \um_set_delcode:n {"2195} % updown arrow
575 \um_set_delcode:n {"219F} % up arrow twohead
576 \um_set_delcode:n {"21A1} % down arrow twohead
577 \um_set_delcode:n {"21A5} % up arrow from bar
578 \um_set_delcode:n {"21A7} % down arrow from bar
579 \um_set_delcode:n {"21A8} % updown arrow from bar
580 \um_set_delcode:n {"21BE} % up harpoon right
581 \um_set_delcode:n {"21BF} % up harpoon left
582 \um_set_delcode:n {"21C2} % down harpoon right
583 \um_set_delcode:n {"21C3} % down harpoon left
584 \um_set_delcode:n {"21C5} % arrows up down
585 \um_set_delcode:n {"21F5} % arrows down up
586 \um_set_delcode:n {"21C8} % arrows up up
587 \um_set_delcode:n {"21CA} % arrows down down
588 \um_set_delcode:n {"21D1} % double up arrow
589 \um_set_delcode:n {"21D3} % double down arrow
590 \um_set_delcode:n {"21D5} % double updown arrow
591 \um_set_delcode:n {"21DE} % up arrow double stroke
592 \um_set_delcode:n {"21DF} % down arrow double stroke
593 \um_set_delcode:n {"21E1} % up arrow dashed
594 \um_set_delcode:n {"21E3} % down arrow dashed
595 }

```

`\um_setup_delcodes:` : TODO : hook into range feature

```

596 \cs_new:Nn \um_set_delcode:nn {
597   \XeTeXdelcode#1 = \csname sym\um_symfont_tl\endcsname #2
598 }
599 \cs_new:Nn \um_set_delcode:n {
600   \XeTeXdelcode#1 = \csname sym\um_symfont_tl\endcsname #1
601 }

```

### 7.3.4 Maths alphabets' character mapping

We want it to be convenient for users to actually type in maths. The ASCII Latin characters should be used for italic maths, and the text Greek characters should be used for upright/italic (depending on preference) Greek, if desired.

`\um_setup_alphanum:` All symbols input that aren't defined directly in `unicode-math-table`.

```

602 \cs_set:Nn \um_setup_alphanum: {

```

```

603 \bool_if:NTF \l_um_init_bool {
604   \um_map_chars_numbers:nn {\um@usv@num}{\um@usv@num}

```

### Normal weight

```

605   \if@um@literal
606     \um_setup_literals:
607   \else
608     \um_setup_Latin:
609     \um_setup_latin:
610     \um_setup_Greek:
611     \um_setup_greek:
612   \fi

```

### Bold

```

613   \if@um@bfliteral
614     \um_setup_bf_literals:
615   \else
616     \if@um@bfupLatin
617       \um_map_chars_latin:nn {\um@usv@bfupLatin,\um@usv@bfitLatin}{\um@usv@bfupLatin}
618     \else
619       \um_map_chars_latin:nn {\um@usv@bfupLatin,\um@usv@bfitLatin}{\um@usv@bfitLatin}
620     \fi
621     \if@um@bfuplatin
622       \um_map_chars_latin:nn {\um@usv@bfuplatin,\um@usv@bfitlatin}{\um@usv@bfuplatin}
623     \else
624       \um_map_chars_latin:nn {\um@usv@bfuplatin,\um@usv@bfitlatin}{\um@usv@bfitlatin}
625     \fi
626     \if@um@bfupGreek
627       \um_map_chars_greek:nn {\um@usv@bfupGreek,\um@usv@bfitGreek}{\um@usv@bfupGreek}
628     \um_map_char:nn {\um@usv@bfvarTheta,\um@usv@bfitvarTheta}{\um@usv@bfvarTheta}
629     \else
630       \um_map_chars_greek:nn {\um@usv@bfupGreek,\um@usv@bfitGreek}{\um@usv@bfitGreek}
631     \um_map_char:nn {\um@usv@bfvarTheta,\um@usv@bfitvarTheta}{\um@usv@bfitvarTheta}
632     \fi
633     \if@um@bfupgreek
634       \um_map_chars_greek:nn {\um@usv@bfupgreek,\um@usv@bfitgreek}{\um@usv@bfupgreek}
635     \um_map_char:nn {\um@usv@bfvarepsilon,\um@usv@bfitvarepsilon}{\um@usv@bfvarepsilon}
636     \um_map_char:nn {\um@usv@bfvartheta,\um@usv@bfitvartheta}{\um@usv@bfvartheta}
637     \um_map_char:nn {\um@usv@bfvarkappa,\um@usv@bfitvarkappa}{\um@usv@bfvarkappa}
638     \um_map_char:nn {\um@usv@bfvarphi,\um@usv@bfitvarphi}{\um@usv@bfvarphi}

### 7.3.5 Functions for setting up the maths alphabets

`\um_mathmap_noparse:Nnn` #1 : Maths alphabet, *e.g.*, `\mathbb`  
#2 : Input slot(s), *e.g.*, the slot for ‘A’ (comma separated)  
#3 : Output slot, *e.g.*, the slot for ‘A’  
Adds `\um_set_mathcode:nnnn` declarations to the specified maths alphabet’s definition (*e.g.*, `\um@mathscr`). Uses `\um@addto@mathmap` (below) to expand the name of the current symbol font.

```

654 \cs_set:Nn \um_mathmap_noparse:Nnn {
655   \clist_map_inline:nn {#2} {
656     \exp_args:No \um@addto@mathmap \um_symfont_t1 {##1}{#1}{#3}
657   }
658 }

```

`\um_mathmap_parse:Nnn` #1 : Maths alphabet, *e.g.*, `\mathbb`  
#2 : Input slot(s), *e.g.*, the slot for ‘A’ (comma separated)  
#3 : Output slot, *e.g.*, the slot for ‘A’  
When `\um@parse@term` is executed, it populates the `\um@char@num@range` macro with slot numbers corresponding to the specified range. This range is used to conditionally add `\um_set_mathcode:nnnn` declarations to the maths alphabet definition (*e.g.*, `\um@mathscr`).

```

659 \cs_set:Nn \um_mathmap_parse:Nnn {
660   \clist_map_inline:Nn \um@char@num@range {
661     \ifnum##1=#3\relax
662       \clist_map_inline:nn {#2} {
663         \exp_args:No \um@addto@mathmap \um_symfont_t1 {####1}{#1}{#3}
664       }
665     \fi
666   }
667 }

```

`\um@addto@mathmap` #1 : Math symbol font, always/usually the expansion of `\um_symfont_t1`  
#2 : Input slot, *e.g.*, the slot for ‘A’

#3 : Maths alphabet, *e.g.*, `\mathbb`

#4 : Output slot, *e.g.*, the slot for ‘A’

This macro is used so that `\um_symfont_t1` can be expanded before entering the `\g@addto@macro` command.

```

668 \newcommand\um@addto@mathmap[4]{
669   \tl_put_right:cn {um_setup_\cs_to_str:N #3:} {
670     \um_set_mathcode:nnnn{#2}{\mathalpha}{#1}{#4}
671   }
672 }
```

## 7.4 (Big) operators

Turns out that  $\text{\XeTeX}$  is clever enough to deal with big operators for us automatically with `\XeTeXmathchardef`. Amazing!

However, the limits aren’t set automatically; that is, we want to define, a la Plain  $\text{\TeX}$  *etc.*, `\def\int{\intop\nolimits}`, so there needs to be a transformation from `\int` to `\intop` during the expansion of `\UnicodeMathSymbol` in the appropriate contexts.

Following is a table of every math operator (`\mathop`) defined in `unicode-math-table.tex`, from which a subset need to be flagged for `\nolimits` adjustments. The limits behaviour as specified by `unicode-math` are shown (with grey ‘scripts’).

usv	Ex.	Macro	Description
U+02140	$\sum\limits_0^1$	<code>\Bbbsum</code>	DOUBLE-STRUCK N-ARY SUMMATION
U+0220F	$\prod\limits_0^1$	<code>\prod</code>	PRODUCT OPERATOR
U+02210	$\coprod\limits_0^1$	<code>\coprod</code>	COPRODUCT OPERATOR
U+02211	$\sum\limits_0^1$	<code>\sum</code>	SUMMATION OPERATOR

U+02A21		<code>\zproject</code>	Z NOTATION SCHEMA PROJECTION
U+02AFC		<code>\biginterleave</code>	LARGE TRIPLE VERTICAL BAR OPERATOR
U+02AFF		<code>\bigtalloblong</code>	N-ARY WHITE VERTICAL BAR

`\um@nolimits` This macro is a sequence containing those maths operators that require a `\nolimits` suffix. This list is used when processing `unicode-math-table.tex` to define such commands automatically (see the macro `\um@set@mathsymbol` on page 26). I’ve chosen essentially just the operators that look like integrals; hopefully a better mathematician can help me out here. I’ve a feeling that it’s more useful *not* to include the multiple integrals such as , but that might be a matter of preference.

```

673 \def\um@nolimits{
674   \@elt\int\@elt\iint\@elt\iiint\@elt\iiint\@elt\oint\@elt\oint\@elt\oiint
675   \@elt\intclockwise\@elt\varointclockwise\@elt\ointctrclockwise\@elt\sumint

```

```

676 \@elt\intbar\@elt\intBar\@elt\oint\@elt\cirfnint\@elt\awint\@elt\rppoint
677 \@elt\scpolint\@elt\ntopolint\@elt\pointint\@elt\sqint\@elt\intlarhk\@elt\intx
678 \@elt\intcap\@elt\intcup\@elt\upint\@elt\lowint
679 }

```

**\addnolimits** This macro appends material to the macro containing the list of operators that don't take limits. See example following for usage. Note at present that this command must have taken effect before `\setmathfont`.

```

680 \newcommand\addnolimits[1]{
681   \expandafter\def\expandafter\um@nolimits\expandafter{\um@nolimits\@elt#1}
682 }

```

**\removenolimits** Can this macro be given a better name? It removes (globally) an item from the `nolimits` list. See example following for usage.

```

683 \def\removenolimits#1{
684   \begingroup
685     \def\@elt##1{
686       \ifx##1#1\else
687         \noexpand\@elt\noexpand##1
688       \fi}
689     \xdef\um@nolimits{\um@nolimits}
690   \endgroup
691 }

```

## 7.5 Radicals

The radical for square root is organised in `\um@set@mathsymbol` on page ?? I think it's the only radical ever. (Actually, there is also `\cuberoot` and `\fourthroot`, but they don't seem to behave as proper radicals.)

Also, what about right-to-left square roots?

**\um@radicals** We organise radicals in the same way as `nolimits`-operators; that is, in a comma-list.

```

692 \def\um@radicals{\sqrt}

```

---

$$\sqrt[2]{1 + \sqrt[3]{1+x}}$$

---

```

\setmathfont{Cambria Math}
\[\sqrt[2]{1+\sqrt[3]{1+x}}\]

```

---

## 7.6 Delimiters

**\left** We redefine the primitive to be preceded by `\mathopen`; this gives much better spacing in cases such as `\sin\left....` Courtesy of Frank Mittelbach:

<http://www.latex-project.org/cgi-bin/ltxbugs2html?pr=latex/3853&prlatex/3754>

<sup>693</sup> `\let\left@primitive\left`

<sup>694</sup> `\def\left{\mathopen{}\left@primitive}`

No re-definition is made for `\right` because it's not necessary.

Here are all `\mathopen` characters:

USV	Ex.	Macro	Description
U+00028	(	<code>\lparen</code>	LEFT PARENTHESIS

U+020EF	̽	<code>\underrightarrow</code>	COMBINING RIGHT ARROW BELOW

## 8 Font features

`\um@zf@feature` Use the same method as `fontspec` for feature definition (*i.e.*, using `xkeyval`) but with a conditional to restrict the scope of these features to unicode-math commands.

```

695 \newcommand\um@zf@feature[2]{
696   \define@key[zf]{options}{#1}[]{}
697   \if@um@fontspec@feature
698     #2
699   \else
700     \PackageError{fontspec/unicode-math}
701       {The ‘#1’ font feature can only be used for maths fonts}
702       {The feature you tried to use can only be in commands
703         like \protect\setmathfont}
704   \fi
705 }
706 }
```

### 8.1 OpenType maths font features

```

707 \um@zf@feature{ScriptStyle}{
708   \zf@update@ff{+ssty=0}
709 }
710 \um@zf@feature{ScriptScriptStyle}{
711   \zf@update@ff{+ssty=1}
712 }
```

### 8.2 Script and scriptscript font options

```

713 \define@cmdkey[um]{options}[um@]{script-features}{}
714 \define@cmdkey[um]{options}[um@]{sscript-features}{}
715 \define@cmdkey[um]{options}[um@]{script-font}{}
716 \define@cmdkey[um]{options}[um@]{sscript-font}{}

```

### 8.3 Range processing

The ‘ALL’ branch here is deprecated and happens automatically.

```

717 \define@choicekey+[um]{options}{range}[\@tempa\@tempb]{ALL}{
718   \ifcase\@tempb\relax
719     \bool_set_true:N \l_um_init_bool
720   \fi
721 }{
722   \bool_set_false:N \l_um_init_bool
723   \seq_clear:N \l_um_char_range_seq

```

```

724 \seq_clear:N \l_um_mathalph_seq
725 \clist_map_inline:nn {#1} {
726   \um_if_mathalph_decl:nTF {##1} {
727     \seq_put_right:Nx \l_um_mathalph_seq { {\exp_not:V\l_um_tmpa_tl} {\exp_not:V\l_um_tmpb_tl} }
728   }{
729     \seq_put_right:Nn \l_um_char_range_seq {##1}
730   }
731 }
732 }
733 \cs_generate_variant:Nn \seq_if_in:NnTF {NV}
734 \prg_new_conditional:Nnn \um_if_mathalph_decl:n {TF} {
735   \tl_set:Nn \l_um_tmpa_tl {#1}
736   \tl_set:Nn \l_um_tmpb_tl {}
737   \tl_set:Nn \l_um_tmpc_tl {}
738   \tl_if_in:NnT \l_um_tmpa_tl {->} {
739     \exp_after:wN \um_split_arrow:w \l_um_tmpa_tl \q_nil
740   }
741   \tl_if_in:NnT \l_um_tmpa_tl {/} {
742     \exp_after:wN \um_split_slash:w \l_um_tmpa_tl \q_nil
743   }
744   \seq_if_in:NVTF \g_um_mathalph_seq \l_um_tmpa_tl {
745     \prg_return_true:
746   }{
747     \prg_return_false:
748   }
749 }
750 \cs_set:Npn \um_split_arrow:w #1->#2 \q_nil {
751   \tl_set:Nn \l_um_tmpa_tl {#1}
752   \tl_set:Nn \l_um_tmpc_tl {#2}
753 }
754 \cs_set:Npn \um_split_slash:w #1/#2 \q_nil {
755   \tl_set:Nn \l_um_tmpa_tl {#1}
756   \tl_set:Nn \l_um_tmpb_tl {#2}
757 }

```

Pretty basic comma separated range processing. Donald Arseneau's selectp package has a cleverer technique.

\um@parse@term #1 : unicode character slot  
 #2 : control sequence (character macro)  
 #3 : control sequence (math type)  
 #4 : code to execute

This macro expands to #4 if any of its arguments are contained in \l\_um\_char\_range\_seq. This list can contain either character ranges (for checking with #1) or control sequences. These latter can either be the command name of a specific character, or the math type of one (e.g., \mathbin).

Character ranges are passed to `\um@parse@range`, which accepts input in the form shown in table 13.

Table 13: Ranges accepted by `\um@parse@range`.

Input	Range
$x$	$r = x$
$x-$	$r \geq x$
$-y$	$r \leq y$
$x-y$	$x \leq r \leq y$

Start by iterating over the commalist, ignoring empties, and initialising the scratch conditional:

```

758 \newcommand\um@parse@term[4]{
759   \seq_map_variable:NNn \l_um_char_range_seq \@ii {
760     \unless\ifx\@ii\@empty
761       \@tempswafalse

```

Match to either the character macro (`\alpha`) or the math type (`\mathbin`):

```

762     \expandafter\um@firstchar\expandafter{\@ii}
763     \ifx\@tempa\um@backslash
764       \expandafter\ifx\@ii#2\relax
765         \@tempswatrue
766       \else
767         \expandafter\ifx\@ii#3\relax
768           \@tempswatrue
769         \fi
770       \fi

```

Otherwise, we have a number range, which is passed to another macro:

```

771     \else
772       \expandafter\um@parse@range\@ii-\@marker-\@nil#1\@nil
773     \fi

```

If we have a match, execute the code! It also populates the `\um@char@num@range` macro, which is used when defining `\mathbf` (*etc.*) `\mathchar` remappings.

```

774     \if@tempswa
775       \ifx\um@char@num@range\@empty
776         \g@addto@macro\um@char@num@range{#1}
777       \else
778         \g@addto@macro\um@char@num@range{, #1}
779       \fi
780     #4%
781   \fi
782 \fi
783 }
784 }

```

```

785 \def\um@firstof#1#2\@nil{#1}
786 \edef\um@backslash{\expandafter\um@firstof\string\string\@nil}
787 \def\um@firstchar#1{\edef\@tempa{\expandafter\um@firstof\string#1\@nil}}

```

\um@parse@range Weird syntax. As shown previously in table 13, this macro can be passed four different input types via \um@parse@term.

```

788 \def\um@parse@range#1-#2-#3\@nil#4\@nil{
789   \def\@tempa{#1}
790   \def\@tempb{#2}

## 9 Maths alphabets mapping definitions

Algorithm for setting alphabet fonts. By default, when `range` is empty, we are in *implicit* mode. If `range` contains the name of the math alphabet, we are in *explicit* mode and do things slightly differently.

Implicit mode:

- Try and set all of the alphabet shapes.
- Check for the first glyph of the uppercase Latin alphabet to detect if the font supports each alphabet shape. (This doesn't work to distinguish Latin/Greek but we hope all maths fonts will have at least them!)
- For alphabets that do exist, overwrite whatever's already there.
- For alphabets that are not supported, *do nothing*. (This includes leaving the old alphabet definition in place.)

Explicit mode:

- Only set the alphabets specified.
- Check for the first glyph of the alphabet to detect if the font contains the alphabet shape in the unicode math plane.
- For unicode math alphabets, overwrite whatever's already there.
- Otherwise, use the ASCII letters instead.

This is every math alphabet known to unicode-math:

`\g_um_mathalph_seq`

1519 }

```

### 9.3 Definitions of the math symbols

Here we define every unicode math codepoint an equivalent macro name. The two are equivalent, in a `\let\xyz=^^^1234` kind of way.

`\um@scancharlet` We need to do some trickery to transform the `\UnicodeMathSymbol` argument  
`\um@scanactivedef` "ABCDEF into the X<sub>Y</sub>TeX ‘caret input’ form `^^^^^abcdef`. It is *very important* that the argument has five characters. Otherwise we need to change the number of ^ chars.

To do this, turn ^ into a regular ‘other’ character and define the macro to perform the lowercasing and `\let`. `\scantokens` changes the carets back into their original meaning after the group has ended and ^’s catcode returns to normal.

```

1520 \begin{group}
1521   \char_make_other:N \^
1522   \cs_gset:Npn \um@scancharlet#1="#2\@nil {
1523     \lowercase{
1524       \scantokens{\global\let#1=^^^^^#2}
1525     }
1526   }

```

Making ^ the right catcode isn’t strictly necessary right now but it helps to future proof us with, e.g., `breqn`.

```

1527 \gdef\um@scanactivedef"#1\@nil#2{
1528   \lowercase{
1529     \tl_rescan:nn{
1530       \ExplSyntaxOn
1531       \char_make_math_superscript:N\^

```

```

1532     }{
1533     \global\def^^^^^#1{#2}
1534     }
1535   }
1536 }
1537 \endgroup

```

Now give `\UnicodeMathSymbol` a definition in terms of `\um@scancharlet` and we're good to go. Make sure `#` is an 'other' so that we don't get confused with `\mathoctothorpe`.

```

1538 \begingroup
1539 \def\UnicodeMathSymbol#1#2#3#4{
1540   \um@scancharlet#2=#1\@nil
1541 }
1542 \char_make_other:N \#
1543 \@input{unicode-math-table.tex}
1544 \endgroup

```

Fix `\backslash`:

```

1545 \group_begin:
1546   \lccode`*=`\\
1547   \char_make_escape:N \
1548   \char_make_other:N \
1549   |lowercase{
1550 |group_end:|let|backslash=*}

```

## 10 Epilogue

Lots of little things to tidy up.

### 10.0.1 Primes

We need a new 'prime' algorithm. Unicode math has four pre-drawn prime glyphs.

```

U+2032: PRIME (\primesingle): x'
U+2033: DOUBLE PRIME (\primedouble): x''
U+2034: TRIPLE PRIME (\primetriple): x'''
U+2057: QUADRUPLE PRIME (\primequadruple): x''''

```

As you can see, they're all drawn at the correct height without being super-scripted. However, in a correctly behaviour OpenType font with the MATH table, we also see different behaviour after the `ssty` feature is applied:

```

U+2032: PRIME in the 'scriptstyle' font: x'

```

The shrinking and offsetting is done as it is turned into a superscript. This means, luckily, that by default things work nicely for single primes. We can write `x\primesingle` or `x^\primesingle` and get:  $x'$  and  $x'$ . To support single primes, then, things are easier than in  $\text{\LaTeX}$ ; we can just map ' to `\prime` and not worry about it.

However, it would be nice to use the pre-composed primes above if they exist in the font; consider  $x'''$  vs.  $x'''$ . Our algorithm is

- Prime encountered; pcount=1.
- Scan ahead; if prime: pcount:=pcount+1; repeat.
- If not prime, stop scanning.
- If pcount=1, `\prime`, end.
- If pcount=2, check `\primedouble`; if it exists, use it, end; if not, goto last step.
- Ditto pcount=3 & `\primetripel`.
- Ditto pcount=4 & `\primequadruple`.
- If pcount>4 or the glyph doesn't exist, insert pcount `\primes` with `\primekern` between each.

```

1551 \muskip_new:N \g_um_primekern_muskip
1552 \muskip_gset:Nn \g_um_primekern_muskip { -\thinmuskip/2 }% arbitrary
1553 \num_new:N \l_um_primecount_num
1554 \cs_new:Nn \um_nprimes:n {
1555   ^{
1556     \primesingle
1557     \prg_replicate:nn {#1-1} { \mskip \g_um_primekern_muskip \primesingle }
1558   }
1559 }
1560 \cs_new:Nn \um_nprimes_select:n {
1561   \prg_case_int:nnn {#1}{
1562     {1} { ^{\primesingle} }
1563     {2} {
1564       \um_glyph_if_exist:nTF {"2033} { ^{\primedouble} } {\um_nprimes:n {#1}}
1565     }
1566     {3} {
1567       \um_glyph_if_exist:nTF {"2034} { ^{\primetripel} } {\um_nprimes:n {#1}}
1568     }
1569     {4} {
1570       \um_glyph_if_exist:nTF {"2057} { ^{\primequadruple} } {\um_nprimes:n {#1}}
1571     }
1572   }{
1573     \um_nprimes:n {#1}

```

```

1574 }
1575 }

```

Scanning is more annoying than you'd think because we want to support all three of `\prime`, `'`, and the unicode prime. And `\ifx` doesn't work with mathactive chars.

```

1576 \cs_new:Nn \um_scanprime: {
1577   \num_zero:N \l_um_primecount_num
1578   \um_scanprime_collect:
1579 }
1580 \cs_new:Nn \um_scanprime_collect: {
1581   \num_incr:N \l_um_primecount_num
1582   \peek_meaning_remove:NTF ' {
1583     \um_scanprime_collect:
1584   }{
1585     \peek_meaning_remove:NTF \um_scanprime: {
1586       \um_scanprime_collect:
1587     }{
1588       \peek_meaning_remove:NTF ^^^^2032 {
1589         \um_scanprime_collect:
1590       }{
1591         \um_nprimes_select:n {\l_um_primecount_num}
1592       }
1593     }
1594   }
1595 }
1596 \cs_set_eq:NN \prime \um_scanprime:
1597 \group_begin:
1598   \char_make_active:N \'
1599   \char_make_active:n {"2032}
1600   \cs_gset_eq:NN ' \um_scanprime:
1601   \cs_gset_eq:NN ^^^^2032 \um_scanprime:
1602 \group_end:

```

## 10.0.2 Unicode radicals

Undo the damage made to `\sqrt`:

```

1603 \DeclareRobustCommand\sqrt{\@ifnextchar[\@sqrt\sqrtsign}

```

`\r@@t` #1 : A mathstyle (for `\mathpalette`)

#2 : Leading superscript for the sqrt sign

A re-implementation of L<sup>A</sup>T<sub>E</sub>X's hard-coded n-root sign using the appropriate `\fontdimens`.

```

1604 \def\r@@t#1#2{
1605   \setbox\z@\hbox{${\m@th #1\sqrtsign{#2}}$}

```

```

1606 \um@scaled@apply{#1}{\kern}{\fontdimen63\um@font}
1607 \raise \dimexpr(
1608     \um@fontdimen@percent{65}{\um@font}\ht\z@-
1609     \um@fontdimen@percent{65}{\um@font}\dp\z@
1610 )\relax
1611 \copy \rootbox
1612 \um@scaled@apply{#1}{\kern}{\fontdimen64\um@font}
1613 \box \z@
1614 }

```

### 10.0.3 Unicode sub- and super-scripts

The idea here is to enter a scanning state after a superscript or subscript is encountered. If subsequent superscripts or subscripts (resp.) are found, they are lumped together. Each sub/super has a corresponding regular size glyph which is used by Xe<sub>La</sub>TeX to typeset the results; this means that the actual subscript/superscript glyphs are never seen in the output document — they are only used as input characters.

Open question: should the superscript-like ‘modifiers’ (U+1D2C: MODIFIER CAPITAL LETTER A and on) be included here?

First, the setup of each mathactive char:

```

1615 \prop_new:N \g_um_supers_prop
1616 \prop_new:N \g_um_subs_prop
1617 \cs_generate_variant:Nn \prop_gput:Nnn {Nxn}
1618 \cs_generate_variant:Nn \prop_get:NnN {cxN}
1619 \cs_generate_variant:Nn \prop_if_in:NnTF {cx}
1620
1621 \group_begin:
1622
1623 % Populate a property list with superscript characters; their mean-
1624 % ing as their key,
1625 % for reasons that will become apparent soon, and their replace-
1626 % ment as each key's value.
1627 % Then make the superscript active and bind it to the scanning function.
1628 %
1629 % \cs{scantokens} makes this process much simpler since we can acti-
1630 % vate the char
1631 % and assign its meaning in one step.
1632 \cs_set:Nn \um_setup_active_superscript:nn {
1633     \prop_gput:Nxn \g_um_supers_prop {\meaning #1} {#2}
1634     \char_make_active:n {`#1}
1635     \global\XeTeXmathcodenum `#1 = "1FFFFF \scan_stop:
1636     \scantokens{
1637         \cs_gset:Npn #1 {
1638             \tl_set:Nn \l_um_ss_chain_tl {#2}
1639             \cs_set_eq:NN \um_sub_or_super:n \sp

```

```

1637         \tl_set:Nn \l_um_tmpa_tl {supers}

1713   }
1714 }
1715
1716 % The main theme here is stolen from the source to the vari-
1717   ous \cs{peek_} functions.
1718 % Consider this function as simply boilerplate:
1719 \cs_new:Nn \um_scan_sscript:TF {
1720   \tl_set:Nx \l_peek_true_aux_tl { \exp_not:n{ #1 } }
1721   \tl_set_eq:NN \l_peek_true_tl \c_peek_true_remove_next_tl
1722   \tl_set:Nx \l_peek_false_tl { \exp_not:n{ \group_align_safe_end: #2 } }
1723   \group_align_safe_begin:
1724   \peek_after:NN \um_peek_execute_branches_ss:
1725 }
1726
1727 % We do not skip spaces when scanning ahead, and we explicitly wish to
1728 % bail out on encountering a space or a brace.

```

```

1728 \cs_new:Npn \um_peek_execute_branches_ss: {
1729   \bool_if:nTF {
1730     \token_if_eq_catcode_p:NN \l_peek_token \c_group_begin_token ||
1731     \token_if_eq_catcode_p:NN \l_peek_token \c_group_end_token ||
1732     \token_if_eq_meaning_p:NN \l_peek_token \c_space_token
1733   }
1734   { \l_peek_false_tl }
1735   { \um_peek_execute_branches_ss_aux: }
1736 }
1737
1738 % This is the actual comparison code.
1739 % Because the peeking has already tokenised the next token,
1740 % it's too late to extract its charcode directly. Instead,
1741 % we look at its meaning, which remains a `character' even
1742 % though it is itself math-active. If the character is ever
1743 % made fully active, this will break our assumptions!
1744 %
1745 % If the char's meaning exists as a property list key, we
1746 % build up a chain of sub-/superscripts and iterate. (If not, exit and
1747 % typeset what we've already collected.)
1748 \cs_new:Nn \um_peek_execute_branches_ss_aux: {
1749   \prop_if_in:cxTF
1750     {g_um_\l_um_tmpa_tl _prop}
1751     {\meaning\l_peek_token}
1752   {
1753     \prop_get:cxN
1754       {g_um_\l_um_tmpa_tl _prop}
1755       {\meaning\l_peek_token}
1756     \l_um_tmpb_tl
1757     \tl_put_right:NV \l_um_ss_chain_tl \l_um_tmpb_tl
1758     \l_peek_true_tl
1759   }
1760   {\l_peek_false_tl}
1761 }

```

#### 10.0.4 Synonyms and all the rest

We need to change L<sup>A</sup>T<sub>E</sub>X's idea of the font used to typeset things like `\sin` and `\cos`:

```

1762 \def\operator@font{\um_setup_mathup:}
1763 \def\to{\rightarrow}
1764 \def\vec{\overrightarrow}
1765 \def\le{\leq}
1766 \def\ge{\geq}
1767 \def\neq{\neq}

```

Define `\colon` as a `mathpunct` `'\colon'`. This is wrong: it should be U+003A: COLON instead!

```

1768 \ifpackage{amsmath}{
1769   % define their own colon, perhaps I should just steal it.
1770 }{
1771   \cs_set_protected:Npn \colon {
1772     \bool_if:NTF \g_um_literal_colon_bool {:\} { \mathpunct{:} }
1773   }
1774 }

```

`\mathcal`

```

1775 \def\mathcal{\mathscr}

```

`\mathrm`

```

1776 \def\mathrm{\mathup}

```

### 10.0.5 Compatibility

Note that `amsmath` will always be loaded before `unicode-math`. (Conflicts occur if you try it the other way around.)

- Since the `mathcode` of `\-` is greater than eight bits, this piece of `\AtBeginDocument` code from `amsmath` dies if we try and set the maths font in the preamble:

```

1777 \ifpackage{amsmath}{
1778   \tl_remove_in:Nn \@begindocumenthook {
1779     \mathchardef\std@minus\mathcode`\-\relax
1780     \mathchardef\std@equal\mathcode`\=\relax
1781   }
1782 }{}

```

- This code is to improve the output of alphabetic symbols in text of operator names (`\sin`, `\cos`, etc.). Just comment out the offending lines for now:

```

1783 \ifpackage{amsopn}{
1784   \cs_set:Npn \newmcodes@ {
1785     \mathcode`\'39
1786     \mathcode`\*42
1787     \mathcode`\."613A%
1788     % \ifnum\mathcode`\-=45 \else
1789     %   \mathchardef\std@minus\mathcode`\-\relax
1790     % \fi
1791     \mathcode`\-45
1792     \mathcode`\ /47
1793     \mathcode`\:"603A\relax
1794   }
1795 }{}

```

Octothorpe is an odd one:

```
1796 \AtBeginDocument{
1797   \def\#{\mode_if_math:TF{\mathoctothorpe}{\char` \#}}
1798   \def\widehat{\hat}
1799   \def\widetilde{\tilde}
1800 }
```

`\digamma` I might end up just changing these in the table.

```
\Digamma 1801 \def\digamma{\updigamma}
1802 \def\Digamma{\upDigamma}
```

Overriding amsmath definitions:

```
1803 \AtBeginDocument{
1804   \def@cdots{\mathinner{\cdots}}
1805 }
```

Interaction with beamer:

```
1806 \@ifclassloaded{beamer}{
1807   \ifbeamer@suppressreplacements\else
1808     \PackageWarningNoLine{unicode-math}{
1809       Disabling~ beamer's~ math~ setup.^{^}
1810       Please~ load~ beamer~ with~ the~ [professionalfonts]~ class~ option
1811     }
1812     \beamer@suppressreplacementstrue
1813   \fi
1814 }{}
```

The end.

```
1815 \ExplSyntaxOff
```

## File II

# STIX table data extraction

The source for the  $\TeX$  names for the very large number of mathematical glyphs are provided via Barbara Beeton's table file for the STIX project ([ams.org/STIX](http://ams.org/STIX)). A version is located at <http://www.ams.org/STIX/bnb/stix-tbl.asc> but check <http://www.ams.org/STIX/> for more up-to-date info.

This table is converted into a form suitable for reading by  $\XeTeX$ , and then hand-edited by the author; the result is `unicode-math-table.tex`.

A single file is produced containing all (more than 3298) symbols. Future optimisations might include generating various (possibly overlapping) subsets so not all definitions must be read just to redefine a small range of symbols. Performance for now seems to be acceptable without such measures.

```

1 #!/bin/sh
2
3 cat stix-tbl.txt |
4 awk '

```

If the USV isn't repeated (TODO: check this is valid!) and the entry isn't one of the weird ones in the big block at the end of the stix table (TODO: check that out!)...

```

5 {if (usv != substr($0,2,5) && substr($0,2,1) != " ")
6     {usv = substr($0,2,5);
7       texname = substr($0,84,25);
8       class = substr($0,57,1);
9       description = tolower(substr($0,233,350));

```

If the USV has a macro name, which isn't `\text...`, and isn't a single character macro (e.g., `\#`, `\S`, ...), and has a class, and it isn't reserved (*i.e.*, doubled up with a previously assigned glyph):

```

10     if (texname ~ /[\\]/ &&
11         substr(texname,0,5) != "\\text" &&
12         substr(texname,0,4) != "\\ipa" &&
13         substr(texname,0,5) != "\\tone" &&
14         substr(texname,3,1) != " " &&
15         class != " " &&
16         description !~ /<reserved>/ )

```

Print the actual entry corresponding to the unicode character:

```

17     print "\\UnicodeMathSymbol{" \" \" \
18         usv "}" \" \
19         texname "}" \" \
20         class "}" \" \
21         description "%";
22     } }' - |

```

Now replace the stix class abbreviations with their T<sub>E</sub>X macro names.

```

23 sed -e ' s/{N}/{\\mathord}/ ' ' \

```

A 'fence' defined by the stix table is something like `\vert`; in X<sub>Y</sub>T<sub>E</sub>X this is just a `\mathord` that will grow with the magic of `\XeTeXmathchardef`.

```

24     -e ' s/{F}/{\\mathord}/ ' ' \
25     -e ' s/{A}/{\\mathalpha}/ ' ' \
26     -e ' s/{D}/{\\mathaccent}/ ' ' \
27     -e ' s/{P}/{\\mathpunct}/ ' ' \
28     -e ' s/{B}/{\\mathbin}/ ' ' \
29     -e ' s/{R}/{\\mathrel}/ ' ' \
30     -e ' s/{L}/{\\mathop}/ ' ' \
31     -e ' s/{O}/{\\mathopen}/ ' ' \
32     -e ' s/{C}/{\\mathclose}/ ' ' \

```

Fixing up a couple of things in the STIX table.

```

33     -e ' s/^\n/string^/ ' ' > unicode-math.tex

```

## A Documenting maths support in the NFSS

### A.1 Overview

In the following,  $\langle NFSS\ decl. \rangle$  stands for something like  $\{T1\}\{lmr\}\{m\}\{n\}$ .

**Maths symbol fonts** Fonts for symbols:  $\alpha$ ,  $\leq$ ,  $\rightarrow$

$\backslash\text{DeclareSymbolFont}\{\langle name \rangle\}\langle NFSS\ decl. \rangle$

Declares a named maths font such as operators from which symbols are defined with  $\backslash\text{DeclareMathSymbol}$ .

**Maths alphabet fonts** Fonts for  $ABC-xyz$ ,  $\mathfrak{ABC}-\mathcal{XYZ}$ , etc.

$\backslash\text{DeclareMathAlphabet}\{\langle cmd \rangle\}\langle NFSS\ decl. \rangle$

For commands such as  $\backslash\text{mathbf}$ , accessed through maths mode that are unaffected by the current text font, and which are used for alphabetic symbols in the ASCII range.

$\backslash\text{DeclareSymbolFontAlphabet}\{\langle cmd \rangle\}\{\langle name \rangle\}$

Alternative (and optimisation) for  $\backslash\text{DeclareMathAlphabet}$  if a single font is being used for both alphabetic characters (as above) and symbols.

**Maths ‘versions’** Different maths weights can be defined with the following, switched in text with the  $\backslash\text{mathversion}\{\langle maths\ version \rangle\}$  command.

$\backslash\text{SetSymbolFont}\{\langle name \rangle\}\{\langle maths\ version \rangle\}\langle NFSS\ decl. \rangle$

$\backslash\text{SetMathAlphabet}\{\langle cmd \rangle\}\{\langle maths\ version \rangle\}\langle NFSS\ decl. \rangle$

**Maths symbols** Symbol definitions in maths for both characters (=) and macros ( $\backslash\text{eqdef}$ ):  $\backslash\text{DeclareMathSymbol}\{\langle symbol \rangle\}\{\langle type \rangle\}\{\langle named\ font \rangle\}\{\langle slot \rangle\}$  This is the macro that actually defines which font each symbol comes from and how they behave.

Delimiters and radicals use wrappers around  $\text{T}_{\text{E}}\text{X}$ ’s  $\backslash\text{delimiter}/\backslash\text{radical}$  primitives, which are re-designed in  $\text{X}_{\text{E}}\text{L}_{\text{A}}\text{T}_{\text{E}}\text{X}$ . The syntax used in  $\text{L}_{\text{A}}\text{T}_{\text{E}}\text{X}$ ’s NFSS is therefore not so relevant here.

**Delimiters** A special class of maths symbol which enlarge themselves in certain contexts.

$\backslash\text{DeclareMathDelimiter}\{\langle symbol \rangle\}\{\langle type \rangle\}\{\langle sym.\ font \rangle\}\{\langle slot \rangle\}\{\langle sym.\ font \rangle\}\{\langle slot \rangle\}$

**Radicals** Similar to delimiters ( $\backslash\text{DeclareMathRadical}$  takes the same syntax) but behave ‘weirdly’.  $\backslash\text{sqrt}$  might very well be the only one.

In those cases, glyph slots in *two* symbol fonts are required; one for the small (‘regular’) case, the other for situations when the glyph is larger. This is not the case in  $\text{X}_{\text{E}}\text{L}_{\text{A}}\text{T}_{\text{E}}\text{X}$ .

Accents are not included yet.

**Summary** For symbols, something like:

```
\def\DeclareMathSymbol#1#2#3#4{
  \global\mathchardef#1"\mathchar@type#2
  \expandafter\hexnumber@\csname sym#2\endcsname
  {\hexnumber@{\count\z@}\hexnumber@{\count\tw@}}}
```

For characters, something like:

```
\def\DeclareMathSymbol#1#2#3#4{
  \global\mathcode`#1"\mathchar@type#2
  \expandafter\hexnumber@\csname sym#2\endcsname
  {\hexnumber@{\count\z@}\hexnumber@{\count\tw@}}}
```

## File III

# X<sub>Y</sub>TeX math font dimensions

These are the extended `\fontdimen`s available for suitable fonts in X<sub>Y</sub>TeX. Note that LuaTeX takes an alternative route, and this package will eventually provide a wrapper interface to the two (I hope).

<code>\fontdimen</code>	Dimension name	Description
10	<code>SCRIPTPERCENTSCALEDOWN</code>	Percentage of scaling down for script level 1. Suggested value: 80%.
11	<code>SCRIPTSCRIPTPERCENTSCALEDOWN</code>	Percentage of scaling down for script level 2 (ScriptScript). Suggested value: 60%.
12	<code>DELIMITEDSUBFORMULAMINHEIGHT</code>	Minimum height required for a delimited expression to be treated as a subformula. Suggested value: normal line height $\times$ 1.5.
13	<code>DISPLAYOPERATORMINHEIGHT</code>	Minimum height of n-ary operators (such as integral and summation) for formulas in display mode.
14	<code>MATHLEADING</code>	White space to be left between math formulas to ensure proper line spacing. For example, for applications that treat line gap as a part of line ascender, formulas with ink going above ( <code>os2.sTypoAscender</code> + <code>os2.sTypoLineGap</code> – <code>MathLeading</code> ) or with ink going below <code>os2.sTypoDescender</code> will result in increasing line height.

\fontdimen	Dimension name	Description
15	AxisHEIGHT	Axis height of the font.
16	ACCENTBASEHEIGHT	Maximum (ink) height of accent base that does not require raising the accents. Suggested: x-height of the font (os2.sxHeight) plus any possible overshots.
17	FLATTENEDACCENTBASE-HEIGHT	Maximum (ink) height of accent base that does not require flattening the accents. Suggested: cap height of the font (os2.sCapHeight).
18	SUBSCRIPTSHIFTDOWN	The standard shift down applied to subscript elements. Positive for moving in the downward direction. Suggested: os2.ySubscriptYOffset.
19	SUBSCRIPTTOPMAX	Maximum allowed height of the (ink) top of subscripts that does not require moving subscripts further down. Suggested: $\frac{1}{5}$ x-height.
20	SUBSCRIPTBASELINEDROPMIN	Minimum allowed drop of the baseline of subscripts relative to the (ink) bottom of the base. Checked for bases that are treated as a box or extended shape. Positive for subscript baseline dropped below the base bottom.
21	SUPERSCRIPSHIFTUP	Standard shift up applied to superscript elements. Suggested: os2.ySuperscriptYOffset.
22	SUPERSCRIPSHIFTUPCRAMPED	Standard shift of superscripts relative to the base, in cramped style.
23	SUPERSCRIPBOTTOMMIN	Minimum allowed height of the (ink) bottom of superscripts that does not require moving subscripts further up. Suggested: $\frac{1}{4}$ x-height.
24	SUPERSCRIPBASELINEDROP-MAX	Maximum allowed drop of the baseline of superscripts relative to the (ink) top of the base. Checked for bases that are treated as a box or extended shape. Positive for superscript baseline below the base top.
25	SUBSUPERSCRIPGAPMIN	Minimum gap between the superscript and subscript ink. Suggested: 4×default rule thickness.

\fontdimen	Dimension name	Description
26	SUPERSCRIPBTOTTOMMAX- WITHSUBSCRIPT	The maximum level to which the (ink) bottom of superscript can be pushed to increase the gap between superscript and subscript, before subscript starts being moved down. Suggested: $\frac{1}{5}$ x-height.
27	SPACEAFTERScript	Extra white space to be added after each subscript and superscript. Suggested: 0.5pt for a 12 pt font.
28	UPPERLIMITGAPMIN	Minimum gap between the (ink) bottom of the upper limit, and the (ink) top of the base operator.
29	UPPERLIMITBASELINERISEMIN	Minimum distance between baseline of upper limit and (ink) top of the base operator.
30	LOWERLIMITGAPMIN	Minimum gap between (ink) top of the lower limit, and (ink) bottom of the base operator.
31	LOWERLIMITBASELINE DROP- MIN	Minimum distance between baseline of the lower limit and (ink) bottom of the base operator.
32	STACKTOPSHIFTUP	Standard shift up applied to the top element of a stack.
33	STACKTOPDISPLAYSTYLESHIFT- UP	Standard shift up applied to the top element of a stack in display style.
34	STACKBOTTOMSHIFTDOWN	Standard shift down applied to the bottom element of a stack. Positive for moving in the downward direction.
35	STACKBOTTOMDISPLAYSTYLE- SHIFTDOWN	Standard shift down applied to the bottom element of a stack in display style. Positive for moving in the downward direction.
36	STACKGAPMIN	Minimum gap between (ink) bottom of the top element of a stack, and the (ink) top of the bottom element. Suggested: $3 \times$ default rule thickness.
37	STACKDISPLAYSTYLEGAPMIN	Minimum gap between (ink) bottom of the top element of a stack, and the (ink) top of the bottom element in display style. Suggested: $7 \times$ default rule thickness.
38	STRETCHSTACKTOPSHIFTUP	Standard shift up applied to the top element of the stretch stack.

\fontdimen	Dimension name	Description
39	STRETCHSTACKBOTTOMSHIFT- DOWN	Standard shift down applied to the bottom element of the stretch stack. Positive for moving in the downward direction.
40	STRETCHSTACKGAPABOVEMIN	Minimum gap between the ink of the stretched element, and the (ink) bottom of the element above. Suggested: UpperLimitGapMin
41	STRETCHSTACKGAPBELOWMIN	Minimum gap between the ink of the stretched element, and the (ink) top of the element below. Suggested: LowerLimitGapMin.
42	FRACTIONNUMERATORSHIFTUP	Standard shift up applied to the numerator.
43	FRACTIONNUMERATOR- DISPLAYSTYLESHIFTUP	Standard shift up applied to the numerator in display style. Suggested: StackTopDisplayStyleShiftUp.
44	FRACTIONDENOMINATORSHIFT- DOWN	Standard shift down applied to the denominator. Positive for moving in the downward direction.
45	FRACTIONDENOMINATOR- DISPLAYSTYLESHIFTDOWN	Standard shift down applied to the denominator in display style. Positive for moving in the downward direction. Suggested: StackBottomDisplayStyleShiftDown.
46	FRACTIONNUMERATORGAP- MIN	Minimum tolerated gap between the (ink) bottom of the numerator and the ink of the fraction bar. Suggested: default rule thickness
47	FRACTIONNUMDISPLAYSTYLE- GAPMIN	Minimum tolerated gap between the (ink) bottom of the numerator and the ink of the fraction bar in display style. Suggested: 3×default rule thickness.
48	FRACTIONRULETHICKNESS	Thickness of the fraction bar. Suggested: default rule thickness.
49	FRACTIONDENOMINATORGAP- MIN	Minimum tolerated gap between the (ink) top of the denominator and the ink of the fraction bar. Suggested: default rule thickness

\fontdimen	Dimension name	Description
50	FRACTIONDENOMDISPLAY- STYLEGAPMIN	Minimum tolerated gap between the (ink) top of the denominator and the ink of the fraction bar in display style. Suggested: 3×default rule thickness.
51	SKewedFRACTION- HORIZONTALGAP	Horizontal distance between the top and bottom elements of a skewed fraction.
52	SKewedFRACTIONVERTICAL- GAP	Vertical distance between the ink of the top and bottom elements of a skewed fraction.
53	OVERBARVERTICALGAP	Distance between the overbar and the (ink) top of the base. Suggested: 3×default rule thickness.
54	OVERBARRULETHICKNESS	Thickness of overbar. Suggested: default rule thickness.
55	OVERBAREXTRAASCENDER	Extra white space reserved above the overbar. Suggested: default rule thickness.
56	UNDERBARVERTICALGAP	Distance between underbar and (ink) bottom of the base. Suggested: 3×default rule thickness.
57	UNDERBARRULETHICKNESS	Thickness of underbar. Suggested: default rule thickness.
58	UNDERBAREXTRADESCENDER	Extra white space reserved below the underbar. Always positive. Suggested: default rule thickness.
59	RADICALVERTICALGAP	Space between the (ink) top of the expression and the bar over it. Suggested: 1¼ default rule thickness.
60	RADICALDISPLAYSTYLE- VERTICALGAP	Space between the (ink) top of the expression and the bar over it. Suggested: default rule thickness + ¼ x-height.
61	RADICALRULETHICKNESS	Thickness of the radical rule. This is the thickness of the rule in designed or constructed radical signs. Suggested: default rule thickness.
62	RADICALEXTRAASCENDER	Extra white space reserved above the radical. Suggested: RadicalRuleThickness.
63	RADICALKERNBEFOREDEGREE	Extra horizontal kern before the degree of a radical, if such is present. Suggested: 5/18 of em.

\fontdimen	Dimension name	Description
64	RADICALKERNAFTERDEGREE	Negative kern after the degree of a radical, if such is present. Suggested: –10/18 of em.
65	RADICALDEGREEBOTTOM-RAISEPERCENT	Height of the bottom of the radical degree, if such is present, in proportion to the ascender of the radical sign. Suggested: 60%.

## Index

Numbers written in *italic* refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in roman refer to the code lines where the entry is used.
