

# Experimental unicode mathematical typesetting: The unicode-math package

Will Robertson

2009/09/17 v0.4

## Abstract

Warning! This package is experimental and subject to change without regard for backwards compatibility. Performance issues may be encountered until algorithms are refined.

## 1 Introduction

This document describes the unicode-math package, which is an *experimental* implementation of a macro to unicode glyph encoding for mathematical characters. Its intended use is for X<sub>Y</sub>TeX, although it is conjectured that some effort could be spent to create a cross-format package that would also work with LuaTeX.

Users who desire to specify maths alphabets only from various fonts may wish to use Andrew Moschou's mathspec package instead.

## 2 Unicode maths font setup

In the ideal case, a single unicode font will contain all maths glyphs we need. The file unicode-math-table.tex (based on Barbara Beeton's stix table) provides the mapping between unicode maths glyphs and macro names (all 3298 — or however many — of them!). A single command

```
\setmathfont[⟨font features⟩]{⟨font name⟩}
```

implements this for every symbol and alphabetic variant. That means  $x$  to  $x$ ,  $\xi$  to  $\xi$ ,  $\leq$  to  $\leq$ , etc.,  $\mathcal{H}$  to  $\mathcal{H}$  and so on, all for unicode glyphs within a single font.

This package deals well with unicode characters for maths input. This includes using literal Greek letters in formulae, resolving to upright or italic depending on preference.

Finally, maths versions must also be provided for. While I guess version selection in L<sup>A</sup>T<sub>E</sub>X will remain the same, the specification for choosing the version fonts will probably be an optional argument:

```
\setmathfont[Version=Bold,⟨font features⟩]{⟨font name⟩}
```

This has not been implemented yet.

Instances above of

`[<font features>]{<font name>}`

follow from my fontspec package, and therefore any additional *<font features>* specific to maths fonts will hook into fontspec's methods.

## 2.1 Using multiple fonts

There will probably be few cases where a single unicode maths font suffices (simply due to glyph coverage). The upcoming `stix` font comes to mind as a possible exception. It will therefore be necessary to delegate specific unicode ranges of glyphs to separate fonts:

`\setmathfont[Range=<unicode range>,<font features>]{<font name>}`

where *<unicode range>* is a comma-separated list of unicode slots and ranges such as `{27D0-27EB, 27FF, 295B-297F}`. You may also use the macro for accessing the glyph, such as `\`, or whole collection of symbols with the same math type, such as `\mathopen`. (Only numerical slots, however, can be used in proper ranges.) This interface still requires some thought.

Not yet implemented: preset names ranges could be used in the range spec., such as `MiscMathSymbolsA`, with such ranges based on unicode chunks. The amount of optimisation required here to achieve acceptable performance has yet to be determined. Techniques such as saving out unicode subsets based on *<unicode range>* data to be `\input` in the next  $\text{\LaTeX}$  run are a possibility, but at this stage, performance without such measures seems acceptable.

## 2.2 Script and scriptscript fonts/features

Cambria Math uses OpenType font features to activate smaller optical sizes for scriptsize and scriptscriptsize symbols (the  $B$  and  $C$ , respectively, in  $A_{B_C}$ ). Other fonts will possibly use entirely separate fonts.

Not yet implemented: Both of these options must be taken into account. I hope this will be mostly automatic from the users' points of view. The `+ssty` feature can be detected and applied automatically, and appropriate optical size information embedded in the fonts will ensure this latter case. Fine tuning should be possible automatically with fontspec options. We might have to wait until `MnMath`, for example, before we really know.

## 3 Maths input

$\text{\XeTeX}$ 's unicode support allows maths input through two methods. Like classical  $\text{\TeX}$ , macros such as `\alpha`, `\sum`, `\pm`, `\leq`, and so on, provide verbose access to the entire repertoire of characters defined by unicode. The literal characters themselves may be used instead, for more readable input files.

Table 1: Effects of the `math-style` package option.

Package option	Example	
	Latin	Greek
<code>math-style=ISO</code>	$(a, z, B, X)$	$(\alpha, \beta, \Gamma, \Xi)$
<code>math-style=TeX</code>	$(a, z, B, X)$	$(\alpha, \beta, \Gamma, \Xi)$
<code>math-style=French</code>	$(a, z, B, X)$	$(\alpha, \beta, \Gamma, \Xi)$

### 3.1 Math ‘style’

Classically,  $\text{\TeX}$  uses italic lowercase Greek letters and *upright* uppercase Greek letters for variables in mathematics. This is contrary to the ISO standards of using italic forms for both upper- and lowercase. Furthermore, the French (contrary again, *quelle surprise*) have been known to use upright uppercase *Latin* letters as well as upright upper- and lowercase Greek.

The `unicode-math` package accommodates these possibilities with an interface heavily inspired by Walter Schmidt’s `lucimatx` package: a package option `math-style` that takes one of three arguments: `TeX`, `ISO`, or `French` (case *in*-sensitive).

The philosophy behind the interface to the mathematical alphabet symbols lies in  $\text{\LaTeX}$ ’s attempt of separating content and formatting. Because input source text may come from a variety of places, the upright and ‘mathematical’ italic Latin and Greek alphabets are *unified* from the point of view of having a specified meaning in the source text. That is, to get a mathematical ‘ $x$ ’, either the ascii (‘keyboard’) letter `x` may be typed, or the actual unicode character may be used. Similarly for Greek letters. The upright or italic forms are then chosen based on the `math-style` package option.

If glyphs are desired that do not map as per the package option (for example, an upright ‘ $g$ ’ is desired but typing `$g$` yields ‘ $g$ ’), *markup* is required to specify this; to follow from the example: `\mathup{g}`. Maths alphabets commands such as `\mathup` are detailed later.

**Alternative interface** However, some users may not like this convention. For them, an upright `x` is an upright ‘`x`’ and that’s that. (This will be the case when obtaining source text from copy/pasting PDF or Microsoft Word documents, for example.) For these users, the `literal` option to `math-style` will effect this behaviour.

The `math-style` options’ effects are shown in brief in table 1. Figure 1 shows every character under the effect of this package option.

$ABCDEFGHIJKLMN\mathbf{OPQRSTUVWXYZ}$   
 $abcdefghijklmn\mathbf{opqrstuvw}\mathbf{xyz}$   
 $\mathbf{AB\Gamma\Delta EZH\Theta\mathbf{I}\mathbf{K}\Lambda MN\mathbf{Ξ}\mathbf{O}\mathbf{Π}\mathbf{Ρ}\mathbf{Σ}\mathbf{T}\mathbf{Υ}\mathbf{Φ}\mathbf{Χ}\mathbf{Ψ}\mathbf{Ω}}$   
 $\alpha\beta\gamma\delta\epsilon\zeta\eta\theta\mathbf{\vartheta}\iota\kappa\lambda\mu\nu\mathbf{\xi}\mathbf{o}\mathbf{π}\mathbf{\omega}\mathbf{\rho}\mathbf{\varsigma}\mathbf{\sigma}\mathbf{\tau}\mathbf{\nu}\mathbf{\phi}\mathbf{\chi}\mathbf{\psi}\mathbf{\omega}$

(a) Package option `[math-style=ISO]`

$ABCDEFGHIJKLMN\mathbf{OPQRSTUVWXYZ}$   
 $abcdefghijklmn\mathbf{opqrstuvw}\mathbf{xyz}$   
 $\mathbf{AB\Gamma\Delta EZH\Theta\mathbf{I}\mathbf{K}\Lambda MN\mathbf{Ξ}\mathbf{O}\mathbf{Π}\mathbf{Ρ}\mathbf{Σ}\mathbf{T}\mathbf{Υ}\mathbf{Φ}\mathbf{Χ}\mathbf{Ψ}\mathbf{Ω}}$   
 $\alpha\beta\gamma\delta\epsilon\zeta\eta\theta\mathbf{\vartheta}\iota\kappa\lambda\mu\nu\mathbf{\xi}\mathbf{o}\mathbf{π}\mathbf{\omega}\mathbf{\rho}\mathbf{\varsigma}\mathbf{\sigma}\mathbf{\tau}\mathbf{\nu}\mathbf{\phi}\mathbf{\chi}\mathbf{\psi}\mathbf{\omega}$

(b) Package option `[math-style=TeX]`

$ABCDEFGHIJKLMN\mathbf{OPQRSTUVWXYZ}$   
 $abcdefghijklmn\mathbf{opqrstuvw}\mathbf{xyz}$   
 $\mathbf{AB\Gamma\Delta EZH\Theta\mathbf{I}\mathbf{K}\Lambda MN\mathbf{Ξ}\mathbf{O}\mathbf{Π}\mathbf{Ρ}\mathbf{Σ}\mathbf{T}\mathbf{Υ}\mathbf{Φ}\mathbf{Χ}\mathbf{Ψ}\mathbf{Ω}}$   
 $\alpha\beta\gamma\delta\epsilon\zeta\eta\theta\mathbf{\vartheta}\iota\kappa\lambda\mu\nu\mathbf{\xi}\mathbf{o}\mathbf{π}\mathbf{\omega}\mathbf{\rho}\mathbf{\varsigma}\mathbf{\sigma}\mathbf{\tau}\mathbf{\nu}\mathbf{\phi}\mathbf{\chi}\mathbf{\psi}\mathbf{\omega}$

(c) Package option `[math-style=French]`

Figure 1: Example maths output demonstrating the `math-style` package option.

### 3.2 Bold switching

Similar as in the previous section, ISO standards differ somewhat to  $\mathrm{T\!E\!X}$ ’s conventions (and classical typesetting) for ‘boldness’ in mathematics. In the past, it has been customary to use bold *upright* letters to denote things like vectors and matrices. For example,  $\mathbf{M} = (M_x, M_y, M_z)$ . Presumably, this was due to the relatively scarcity of bold italic fonts in the pre-digital typesetting era. It has been suggested that *italic* bold symbols are used nowadays instead.

Bold Greek letters have simply been bold variant glyphs of their regular weight, as in  $\mathbf{\xi} = (\xi_r, \xi_\varphi, \xi_\theta)$ . Confusingly, the syntax in  $\mathrm{L\!A\!T\!E\!X}$  has been different for these two examples: `\mathbf{bf}` in the former ( $\mathbf{M}$ ), and `\bm` (or `\boldsymbol`, deprecated) in the latter ( $\mathbf{\xi}$ ).

In unicode-math, the `\mathbf{bf}` command works directly with both Greek and Latin maths alphabet characters and depending on package option either switches to upright for Latin letters (`bold-style=TeX`) as well or keeps them italic (`bold-style=ISO`).

To match the package options for non-bold characters, for `bold-style=French` all bold characters are upright, and `bold-style=literal` does not change the upright/italic shape of the letter.

Upright and italic bold mathematical letters input as direct unicode characters are normalised with the same rules. For example, with `bold-style=TeX`, a literal bold italic latin character will be typeset upright.

Note that `bold-style` is independent of `math-style`, although if the former is not specified then sensible defaults are chosen based on the latter.

Table 2: Effects of the bold-style package option.

Package option	Example	
	Latin	Greek
<code>bold-style=ISO</code>	$(\mathbf{a}, \mathbf{z}, \mathbf{B}, \mathbf{X})$	$(\alpha, \beta, \Gamma, \Xi)$
<code>bold-style=TeX</code>	$(\mathbf{a}, \mathbf{z}, \mathbf{B}, \mathbf{X})$	$(\alpha, \beta, \Gamma, \Xi)$
<code>bold-style=French</code>	$(\mathbf{a}, \mathbf{z}, \mathbf{B}, \mathbf{X})$	$(\alpha, \beta, \Gamma, \Xi)$

**ABCDEFGHIJKLMNOPQRSTUVWXYZ**  
**abcdefghijklmnopqrstuvwxyz**  
**ΑΒΓΔΕΖΗΘΙΚΛΜΝΞΟΠΡΘΣΤΥΦΧΨΩ**  
**αβγδεζηθικλμνξοπρςστυφχψωεθκφρω**

(a) Package option [`bold-style=ISO`]

**ABCDEFGHIJKLMNOPQRSTUVWXYZ**  
**abcdefghijklmnopqrstuvwxyz**  
**ΑΒΓΔΕΖΗΘΙΚΛΜΝΞΟΠΡΘΣΤΥΦΧΨΩ**  
**αβγδεζηθικλμνξοπρςστυφχψωεθκφρω**

(b) Package option [`bold-style=TeX`]

**ABCDEFGHIJKLMNOPQRSTUVWXYZ**  
**abcdefghijklmnopqrstuvwxyz**  
**ΑΒΓΔΕΖΗΘΙΚΛΜΝΞΟΠΡΘΣΤΥΦΧΨΩ**  
**αβγδεζηθικλμνξοπρςστυφχψωεθκφρω**

(c) Package option [`bold-style=French`]

Figure 2: Example maths output demonstrating the bold-style package option.

The bold-style options' effects are shown in brief in table 2. Figure 2 on the next page shows every character under the effect of this package option.

### 3.3 Mathematical alphabets

Unicode contains separate codepoints for most if not all variations of alphabet shape one may wish to use in mathematical notation. The complete list is shown in table 3.

At present, the math font switching commands do not nest; therefore if you want sans serif bold, you must write `\mathsf{bfup}` rather than `\mathbf{\mathsf{\{...\}}}`. This may change in the future.

Table 3: Mathematical alphabets defined in unicode. Black dots indicate an alphabet exists in the font specified; grey dots indicate shapes that should always be taken from the upright font even in the italic style.

Font				Alphabet		
Style	Shape	Series	Switch	Latin	Greek	Numerals
Serif	Upright	Normal	<code>\mathup</code>	•	•	•
		Bold	<code>\mathbfup</code>	•	•	•
	Italic	Normal	<code>\mathit</code>	•	•	•
		Bold	<code>\mathbfit</code>	•	•	•
Sans serif	Upright	Normal	<code>\mathsfup</code>	•		•
	Italic	Normal	<code>\mathsfit</code>	•		•
	Upright	Bold	<code>\mathsfbfup</code>	•	•	•
	Italic	Bold	<code>\mathsfbfit</code>	•	•	•
Typewriter	Upright	Normal	<code>\mathtt</code>	•		•
Double-struck	Upright	Normal	<code>\mathbb</code>	•		•
Script	Upright	Normal	<code>\mathscr</code>	•		
		Bold	<code>\mathbfscr</code>	•		
Fraktur	Upright	Normal	<code>\mathfrak</code>	•		
		Bold	<code>\mathbffrac</code>	•		

## 3.4 Miscellanea

### 3.4.1 Nabla

The symbol  $\nabla$  comes in the six forms shown in table 4. We want an individual option to specify whether we want upright or italic nabla by default (when either upright or italic nabla is used in the source).  $\text{\TeX}$  classically uses an upright nabla, but ISO standards differ (I think). The package options `nabla=upright` and `nabla=italic` switch between the two choices. This is then inherited through `\mathbf`; `\mathit` and `\mathup` can be used to force one way or the other.

`nabla=italic` is implicit when using `math-style=ISO` and `nabla=upright` follows both `math-style=TeX` and `math-style=French`.

### 3.4.2 Partial

The same applies to the symbols `U+2202: PARTIAL DIFFERENTIAL` and `U+1D715: MATH ITALIC PARTIAL DIFFERENTIAL`.

At time of writing, both the Cambria Math and STIX fonts display these two glyphs in the same italic style, but this is hopefully a bug that will be corrected in the future — the ‘plain’ partial differential should really have an upright shape.

Use the `partial=upright` or `partial=italic` package options to specify

Table 4: The various forms of nabla.

Description		Glyph
Upright	Serif	$\nabla$
	Bold serif	<b><math>\nabla</math></b>
	Bold sans	<b><math>\nabla</math></b>
Italic	Serif	$\nabla$
	Bold serif	<b><math>\nabla</math></b>
	Bold sans	<b><math>\nabla</math></b>

Table 5: The various forms of the partial differential. Note that in the fonts used to display these glyphs, the first upright partial is incorrectly shown in an italic style.

Description		Glyph
Regular	Upright	$\partial$
	Italic	$\partial$
Bold	Upright	<b><math>\partial</math></b>
	Italic	<b><math>\partial</math></b>
Sans bold	Upright	<b><math>\partial</math></b>
	Italic	<b><math>\partial</math></b>

which one you would like. The default is (always, unless someone requests and argues otherwise) `partial=italic`.<sup>1</sup>

See table 5 for the variations on the partial differential symbol.

### 3.4.3 Epsilon and phi: $\epsilon$ vs. $\varepsilon$ and $\phi$ vs. $\varphi$

$\text{\TeX}$  defines `\epsilon` to look like  $\varepsilon$  and `\varepsilon` to look like  $\epsilon$ . The Unicode glyph directly after delta and before zeta is ‘epsilon’ and looks like  $\epsilon$ ; there is a subsequent variant of epsilon that looks like  $\varepsilon$ . This creates a problem. People who use unicode input won’t want their glyphs transforming;  $\text{\TeX}$  users will be confused that what they think as ‘normal epsilon’ is actual the ‘variant epsilon’. And the same problem exists for ‘phi’.

We have a package option to control this behaviour. With `vargreek-shape=TeX`, `\phi` and `\epsilon` produce  $\phi$  and  $\epsilon$  and `\varphi` and `\varepsilon` produce  $\varphi$  and  $\varepsilon$ . With `vargreek-shape=unicode`, these symbols are swapped. Note, however, that unicode characters are not affected by this option. That is, no remapping occurs of the characters/glyphs, only the control sequences.

<sup>1</sup>A good argument would revolve around some international standards body recommending up-right over italic. I just don’t have the time right now to look it up.

A	0	1	2	3	4	5	6	7	8	9	+	-	=	(	)	i	n	Z
---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---

Figure 3: The unicode superscripts supported as input characters. These are the literal glyphs from Charis SIL, not the output seen when used for maths input. The ‘A’ and ‘Z’ are to provide context for the size and location of the superscript glyphs.

Unless `math-style=literal` is in effect, the default is to use `vargreek-shape=TeX`.

U+3B5: GREEK SMALL LETTER EPSILON  
U+3F5: GREEK LUNATE EPSILON SYMBOL  
U+3C6: GREEK SMALL LETTER PHI  
U+3D5: GREEK SMALL LETTER SCRIPT PHI

### 3.4.4 Primes

Primes ( $x'$ ) may be input in several ways. You may use any combination of `ascii` straight quote (`'`), `unicode` prime (`'`), and `\prime`; when multiple primes occur next to each other, they chain together to form double, triple, or quadruple primes if the font contains pre-drawn glyphs. These may also be accessed with `\primedouble`, `\primetriples`, and `\primequadruple`.

If the font does not contain the pre-drawn glyphs or more than four primes are used, the single prime glyph is used multiple times with a negative kern to get the spacing right. There is no user interface to adjust this negative kern yet (because I haven’t decided what it should look like); if you need to, write something like this:

```
\ExplSyntaxOn
\muskip_gset:Nn \g_um_primekern_muskip { -\thinmuskip/2 }
\ExplSyntaxOff
```

### 3.4.5 Unicode subscripts and superscripts

You may, if you wish, use unicode subscripts and superscripts in your source document. For basic expressions, the use of these characters can make the input more readable. Adjacent sub- or super-scripts will be concatenated into a single expression.

The range of subscripts and superscripts supported by this package are shown in figures 3 and 4. Please request more if you think it is appropriate.

$\mathbf{A}$ $\subscript{0}$ $\subscript{1}$ $\subscript{2}$ $\subscript{3}$ $\subscript{4}$ $\subscript{5}$ $\subscript{6}$ $\subscript{7}$ $\subscript{8}$ $\subscript{9}$ $\subscript{+}$ $\subscript{-}$ $\subscript{=}$ $\subscript{(}$ $\subscript{)}$ $\subscript{a}$ $\subscript{e}$ $\subscript{i}$ $\subscript{o}$ $\subscript{r}$ $\subscript{u}$ $\subscript{v}$ $\subscript{x}$ $\subscript{\beta}$ $\subscript{\gamma}$ $\subscript{\rho}$ $\subscript{\varphi}$ $\subscript{\chi}$ $\mathbf{Z}$
--

Figure 4: The unicode subscripts supported as input characters. See note from figure 3.

### 3.4.6 Vertical bar ‘|’

### 3.4.7 Colon ‘:’

### 3.4.8 Normalising some input characters

I believe all variant forms should be used as legal input that is normalised to a consistent output glyph, because we want to be fault-tolerant in the input. Here are the duplicates:

U+251: LATIN SMALL LETTER ALPHA U+25B: LATIN SMALL LETTER EPSILON U+263: LATIN SMALL LETTER GAMMA U+269: LATIN SMALL LETTER IOTA U+278: LATIN SMALL LETTER PHI U+28A: LATIN SMALL LETTER UPSILON U+190: LATIN CAPITAL LETTER EPSILON U+194: LATIN CAPITAL LETTER GAMMA U+196: LATIN CAPITAL LETTER IOTA U+1B1: LATIN CAPITAL LETTER UPSILON

(Not yet implemented.)

## File I

# The unicode-math package

This is the package.

```

1 \ProvidesPackage{unicode-math}
2 [2009/09/17 v0.4 Unicode maths in XeLaTeX]
```

## 4 Things we need

### Packages

```

3 \RequirePackage{expl3}[2009/08/12]
4 \RequirePackage{xparse}[2009/08/31]
5 \RequirePackage{fontspec}

    Start using LATEX3 — finally!

6 \ExplSyntaxOn
```

### Counters and conditionals

```

7 \newcounter{um@fam}
8 \newif\if@um@fontspec@feature
```

```
9 \newif\if@um@ot@math@
```

For math-style:

281 }

```

### 4.3 Other things

`\um@fontdimen@percent` #1 : Font dimen number  
`\fontdimens` 10, 11, and 65 aren't actually dimensions, they're percentage values given in units of sp. This macro takes a font dimension number and outputs the decimal value of the associated parameter.

---

0.73	<code>\font\tmpfont="Cambria Math"</code>
0.60	<code>\um@fontdimen@percent{10}{\tmpfont}\</code>
0.65	<code>\um@fontdimen@percent{11}{\tmpfont}\</code>
	<code>\um@fontdimen@percent{65}{\tmpfont}</code>

---

```

282 \def\um@fontdimen@percent#1#2{
283   0.\strip@pt\dimexpr\fontdimen#1#2 *65536\relax
284 }

```

`\um@scaled@apply` #1 : A math style  
 #2 : Macro that takes a non-delimited length argument (like `\kern`)  
 #3 : Length control sequence to be scaled according to the math style  
 This macro is used to scale the lengths reported by `\fontdimen` according to the scale factor for script- and scriptscript-size objects.

```

285 \def\um@scaled@apply#1#2#3{
286   \ifx#1\scriptstyle
287     #2\um@fontdimen@percent{10}\um@font#3
288   \else
289     \ifx#1\scriptscriptstyle
290       #2\um@fontdimen@percent{11}\um@font#3
291     \else
292       #2#3%
293     \fi
294   \fi
295 }

```

## 5 Fundamentals

### 5.1 Enlarging the number of maths families

To start with, we've got a power of two as many `\fams` as before. So (from `ltxssbas.dtx`) we want to redefine

```

296 \def\new@mathgroup{\alloc@8\mathgroup\chardef\@cclvi}
297 \let\newfam\new@mathgroup

```

This is sufficient for L<sup>A</sup>T<sub>E</sub>X's `\DeclareSymbolFont`-type commands to be able to define 256 named maths fonts. Now we need a new `\DeclareMathSymbol`.

### 5.2 `\DeclareMathSymbol` for unicode ranges

This command is a bit funny at the moment; it doesn't define the actual macro for almost all of the symbols passed to it, but it does assign the `\XeTeXmathchar`.

`\um@mathsymbol` #1 : Symbol, *e.g.*, `\alpha`  
 #2 : Type, *e.g.*, `\mathalpha`

#3 : Math font name, *e.g.*, operators

#4 : Slot, *e.g.*, "221E

```
298 \def \um@mathsymbol#1#2#3#4{
299 \expandafter\um@set@mathsymbol\csname sym#3\endcsname#1#2{#4}}
```

The final macros that actually define the maths symbol with  $\text{\LaTeX}$  primitives.

```
\um@set@mathsymbol #1 : Symbol font number
#2 : Symbol macro, e.g., \alpha
#3 : Type, e.g., \mathalpha
#4 : Slot, e.g., "221E
```

If the symbol definition is for a macro. There are a bunch of tests to perform to process the various characters.

```
300 \def\um@set@mathsymbol#1#2#3#4{
```

**Operators** In the examples following, say we're defining for the symbol  $\sum(\Sigma)$ .

```
301 \ifx\mathop#3\relax
```

In order for literal unicode characters to be used in the source and still have the correct limits behaviour, big operators are made math-active.

The active math char is  $\backslash$ let to the macro  $\sum@op$ .

```
302 \begingroup
303 \char_make_active:n {#4}
304 \global\mathcode#4="8000\relax
305 \um@scanactivedef #4 \@nil { \csname\string#2@op\endcsname }
306 \endgroup
```

Some of these require a  $\backslash$ nolimits suffix. This is controlled by the  $\um@nolimits$  macro, which contains a list of such characters. This list is checked dynamically because we're not interested in efficiency. Or something. This allows the list to be updated in the middle of a document.

Declare the plain old mathchardef for the control sequence  $\sum@sym$ .

```
307 \expandafter\global\expandafter\XeTeXmathchardef
308 \csname\string#2@sym\endcsname
309 =" \mathchar@type#3 #1 #4\relax
```

Now define  $\sum@op$  as  $\sum@sym$ , followed by  $\backslash$ nolimits if necessary.

```
310 \cs_gset:cpn { \string#2 @op } {
311 \csname\string#2@sym\endcsname
312 \expandafter\in\expandafter#2\expandafter{\um@nolimits}
313 \ifin@
314 \expandafter\limits
315 \fi
316 }
```

Don't forget that the actual `\sum` macro is simply defined in terms of the literal unicode symbol!

```
317 \else
```

**Radicals** Needs to be before the delimiters because the radical is, for some reason, `\mathopen`.

```
318 \expandafter\in@\expandafter#2\expandafter{\um@radicals,}
319 \ifin@
320 \cs_gset:cpn {\cs_to_str:N #2 sign} { \XeTeXradical #1 #4 \relax }
321 \else
```

**Delimiters** TODO: sort out which of these three declarations are necessary! (Definitely the first, to work with `\left/\right`.)

```
322 \ifx\mathopen#3\relax
323 \cs_gset:Npn #2 {\XeTeXdelimiter "\mathchar@type#3 #1 #4\relax}
324 \global\XeTeXdelcode#4=#1 #4\relax
325 \global\XeTeXmathcode#4="\mathchar@type#3 #1 #4\relax
326 \else
327 \ifx\mathclose#3\relax
328 \cs_gset:Npn #2 {\XeTeXdelimiter "\mathchar@type#3 #1 #4\relax}
329 \global\XeTeXdelcode#4=#1 #4\relax
330 \global\XeTeXmathcode#4="\mathchar@type#3 #1 #4\relax
331 \else
```

**Accents**

```
332 \ifx\mathaccent#3\relax
333 \cs_gset:Npx #2 {\XeTeXmathaccent "\mathchar@type#3 #1 #4\relax}
334 \else
```

And finally, the general case. We define the unicode mathcode for the character. The macro is defined generically in terms of the unicode character.

```
335 \global\XeTeXmathcode#4="\mathchar@type#3 #1 #4\relax
336 \fi
337 \fi
338 \fi
339 \fi
340 \fi
341 }
```

`\um_set_mathcode:nnnn` [For later] or if it's for a character code (just a wrapper around the primitive). Note that this declaration *isn't* global so that it can be constrained by grouping inside math alphabet switches.

```
342 \cs_set:Nn \um_set_mathcode:nnnn {
343 \XeTeXmathcode#1="\mathchar@type#2 \csname sym#3\endcsname #4\relax
344 }
```

### 5.3 The main `\setmathfont` macro

Here's the simplest usage:

---

$Ax \triangleq \nabla \times \mathcal{L}$	<pre>\setmathfont{Asana Math} \$Ax \eqdef \nabla \times \mscrZ\$</pre>
---	--

---

An interesting (perhaps useless) example of the Range feature:

---

$F(s) = \mathcal{L}\{f(t)\} = \int_0^\infty e^{-st} f(t) dt$	<pre>\setmathfont[Colour=000000]{Asana Math} \setmathfont[Range={\mathop}, Colour=FF0000]{Asana Math} \setmathfont[Range={\equal}, Colour=009900]{Asana Math} \setmathfont[Range={\mathopen,\mathclose},               Colour=0000FF]{Asana Math} \[ F(s)=\mscrL\{f(t)\}=\int_0^\infty \mathop{e}^{-st}f(t)\,\mathop{d} t \]</pre>
--	--

---

Using a Range including large character sets such as `\mathrel`, `\mathalpha`, *etc.*, is *very slow*! I hope to improve the performance somehow.

`\setmathfont` [#1]: font features

#2 : font name

345 `\DeclareDocumentCommand \setmathfont { O{} m } {`

- Erase any conception L<sup>A</sup>T<sub>E</sub>X has of previously defined math symbol fonts; this allows `\DeclareSymbolFont` at any point in the document.

346 `\let\glb@currsizel\relax`

- To start with, assume we're defining the font for every math symbol character.

347 `\let\um@char@range\@empty`

348 `\let\um@char@num@range\@empty`

- Tell fontspec that maths font features are actually allowed.

349 `\um@fontspec@featuretrue`

- Grab the current size information (is this robust enough? Maybe it should be preceded by `\normalsize`).

350 `\csname S@f@size\endcsname`

- Set the name of the math version being defined. (obviously more needs to be done here!)

```

351 \def\um@mversion{normal}
352 \DeclareMathVersion{\um@mversion}

```

Define default font features for the script and scriptscript font. (This needs to be generalised so users can override it.)

```

353 \tl_set:Nn \l_um_script_features_tl {ScriptStyle}
354 \tl_set:Nn \l_um_sscript_features_tl {ScriptScriptStyle}
355 \tl_set:Nn \l_um_script_font_tl      {#2}
356 \tl_set:Nn \l_um_sscript_font_tl    {#2}

```

Use fontspec to select a font to use. The macro `\Se<size>` contains the definitions of the sizes used for maths letters, subscripts and subsubscripts in `\tf@size`, `\sf@size`, and `\ssf@size`, respectively.

```

357 \setkeys*[um]{options}{#1}
358 \edef\@tempa{\noexpand\zf@fontspec{
359     Script = Math,
360     SizeFeatures = {
361         {Size = \tf@size-} ,
362         {Size = \sf@size-\tf@size ,
363         Font = \l_um_script_font_tl ,
364         \l_um_script_features_tl
365         } ,
366         {Size = -\ssf@size ,
367         Font = \l_um_sscript_font_tl ,
368         \l_um_sscript_features_tl
369         }
370     },
371     \XKV@rm
372 }{#2}
373 }
374 \@tempa

```

Probably want to check there that we're not creating multiple symbol fonts with the same NFSS declaration.

Check for the correct number of `\fontdimens`:

```

375 \font\um@font="#2"\relax
376 \ifdim \dimexpr\fontdimen9\um@font*65536\relax =65pt\relax
377     \um@ot@math@true
378 \else
379     \PackageWarningNoLine{unicode-math}{
380         The~ font~ '#2' ~is~ not~ a~ valid~ OpenType~ maths~ font.~
381         Some~ maths~ features~ will~ not~ be~ available~ or~ behave~
382         in~ a~ substandard~ manner
383     }
384 \fi

```

If we're defining the full unicode math repertoire, then we skip all the parsing processing needed if we're only defining a subset.

- Math symbols are defined with `\UnicodeMathSymbol`; see section §5.3.1 for the individual definitions

```

385 \ifx\um@char@range\@empty
386   \tl_set:Nn \um_symfont_tl {um@allsym}
387   \PackageInfo{unicode-math}{Defining~ the~ default~ maths~ font~ as~ '#2'}
388   \cs_set_eq:NN \UnicodeMathSymbol \um_process_symbol_noparse:nnnn
389   \cs_set_eq:NN \um_mathmap:Nnn \um_mathmap_noparse:Nnn
390   \cs_set_eq:NN \um_remap_symbol:nnn \um_remap_symbol_noparse:nnn
391   \cs_set_eq:NN \um_maybe_init_alphabet:n \um_init_alphabet:n
392 \else
393   \stepcounter{um@fam}
394   \tl_set:Nx \um_symfont_tl {um@fam\theum@fam}
395   \cs_set_eq:NN \UnicodeMathSymbol \um_process_symbol_parse:nnnn
396   \cs_set_eq:NN \um_mathmap:Nnn \um_mathmap_parse:Nnn
397   \cs_set_eq:NN \um_remap_symbol:nnn \um_remap_symbol_parse:nnn
398   \cs_set_eq:NN \um_maybe_init_alphabet:n \use_none:n
399 \fi

```

Now defined `\um_symfont_tl` as the  $\LaTeX$  math font to access everything:

```

400 \DeclareSymbolFont{\um_symfont_tl}
401   {\encodingdefault}{\zf@family}{\mddefault}{\updefault}

```

And now we input every single maths char. See File II for the source to `unicode-math.tex` which is used to create `unicode-math-table.tex`.

```

402 \input{unicode-math-table.tex}

```

Finally,

- Set up shapes for italic/upright or ordinary/var symbols as per package options.
- Remap symbols that don't take their natural mathcode
- Activate any symbols that need to be math-active
- Setup all symbols not covered by the table (mostly alphanumerics)
- Setup the maths alphabets (`\mathbf` etc.)

```

403 \um_setup_shapes:
404 \um_remap_symbols:
405 \um_setup_mathactives:
406 \um_setup_alphanum:
407 \um_setup_alphabets:

```

End of the `\setmathfont` macro.

```

408 }

```

```

409 \cs_new:Nn \um_setup_shapes: {
410   \um_setup_nabla:
411   \um_setup_partial:
412 }

```

### 5.3.1 Functions for setting up symbols with mathcodes

`\um_process_symbol_noparse:nnnn` If the Range font feature has been used, then only a subset of the unicode glyphs are to be defined. See section §6.3 for the code that enables this.

```

413 \cs_set:Nn \um_process_symbol_noparse:nnnn {
414   \um@mathsymbol{#2}{#3}{\um_symfont_tl}{#1}
415 }

416 \cs_set:Nn \um_process_symbol_parse:nnnn {
417   \um@parse@term{#1}{#2}{#3}{
418     \um_process_symbol_noparse:nnnn{#1}{#2}{#3}{#4}
419   }
420 }

```

`\um_remap_symbols:` This function is used to define the mathcodes for those chars which should be mapped to a different glyph than themselves.

```

\um_remap_symbol_noparse:nnn
\um_remap_symbol_parse:nnnn
421 \cs_new:Nn \um_remap_symbols: {
422   \um_remap_symbol:nnn{"2D}{\mathbin}{"02212}% hyphen to minus
423   \if@um@literal
424     \um_remap_symbol:nnn {\um@usv@Nabla}{\mathord}{\um@usv@Nabla}
425     \um_remap_symbol:nnn {\um@usv@itNabla}{\mathord}{\um@usv@itNabla}
426     \um_remap_symbol:nnn {\um@usv@partial}{\mathord}{\um@usv@partial}
427     \um_remap_symbol:nnn {\um@usv@itpartial}{\mathord}{\um@usv@itpartial}

429     \um_remap_symbol:nnn {\um@usv@Nabla,\um@usv@itNabla}{\mathord}{\um@Nabla_up_or_it_usv}
430     \um_remap_symbol:nnn {\um@usv@partial,\um@usv@itpartial}{\mathord}{\um@partial_up_or_it_usv}
431   \fi

```

Some of these in the `bfliteral` block may be redundant, but that's okay:

```

432 \if@um@bfliteral
433   \um_remap_symbol:nnn {\um@usv@bfNabla}{\mathord}{\um@usv@bfNabla}
434   \um_remap_symbol:nnn {\um@usv@bfitNabla}{\mathord}{\um@usv@bfitNabla}
435   \um_remap_symbol:nnn {\um@usv@bfsfNabla}{\mathord}{\um@usv@bfsfNabla}
436   \um_remap_symbol:nnn {\um@usv@bfsfitNabla}{\mathord}{\um@usv@bfsfitNabla}
437   \um_remap_symbol:nnn {\um@usv@bfpartial}{\mathord}{\um@usv@bfpartial}
438   \um_remap_symbol:nnn {\um@usv@bfitpartial}{\mathord}{\um@usv@bfitpartial}
439   \um_remap_symbol:nnn {\um@usv@bfsfpartial}{\mathord}{\um@usv@bfsfpartial}
440   \um_remap_symbol:nnn {\um@usv@bfsfitpartial}{\mathord}{\um@usv@bfsfitpartial}
441 \else
442   \um_remap_symbol:nnn {\um@usv@bfNabla,\um@usv@bfitNabla}{\mathord}{\um@bfNabla_up_or_it_usv}
443   \um_remap_symbol:nnn {\um@usv@bfsfNabla,\um@usv@bfsfitNabla}{\mathord}{\um@bfsfNabla_up_or_it_usv}
444   \um_remap_symbol:nnn {\um@usv@bfpartial,\um@usv@bfitpartial}{\mathord}{\um@bfpartial_up_or_it_usv}

```

```

445 \um_remap_symbol:nnn {\um@usv@bfsfpartial,\um@usv@bfsfitpartial}{\mathord}{\um_bfsfpartial_
446 \fi
447 }

```

Where `\um_remap_symbol:nnn` is defined to be one of these two, depending on the range setup:

```

448 \cs_new:Nn \um_remap_symbol_parse:nnn {
449   \um@parse@term {#3} {\@nil} {#2} {
450     \um_remap_symbol_noparse:nnn {#1} {#2} {#3}
451   }
452 }
453 \cs_new:Nn \um_remap_symbol_noparse:nnn {
454   \clist_map_inline:nn {#1} {
455     \um_set_mathcode:nnnn {##1} {#2} {\um_symfont_tl} {#3}
456   }
457 }

```

### 5.3.2 Active math characters

There are more math active chars later in the subscript/superscript section. But they don't need to be able to be typeset directly.

`\um_setup_mathactives:`

```

458 \cs_new:Nn \um_setup_mathactives: {
459   \um_make_mathactive:nNN {"2032} \primesingle \mathord
460 }

```

`\um_make_mathactive:nNN` Makes #1 a mathactive char, and gives cs #2 the meaning of mathchar #1 with class #3. You are responsible for giving active #1 a particular meaning!

```

461 \cs_new:Nn \um_make_mathactive:nNN {
462   \XeTeXmathchardef #2 = "\mathchar@type #3
463                               \csname sym\um_symfont_tl\endcsname
464                               #1 \scan_stop:
465   \XeTeXmathcodenum #1 = "1FFFFF \scan_stop:
466 }

```

### 5.3.3 Maths alphabets' character mapping

We want it to be convenient for users to actually type in maths. The ASCII Latin characters should be used for italic maths, and the text Greek characters should be used for upright/italic (depending on preference) Greek, if desired.

`\um_setup_alphanum:` All symbols input that aren't defined directly in `unicode-math-table`.

```

467 \cs_set:Nn \um_setup_alphanum: {
468   \ifx\um@char@range\empty
469     \um_map_chars_numbers:nn {\um@usv@num}{\um@usv@num}

```

## Normal weight

```

516   \else
: TODO : what is supposed to happen here?
517   \fi
518 }

```

### 5.3.4 Functions for setting up the maths alphabets

`\um_mathmap_noparse:Nnn` #1 : Maths alphabet, *e.g.*, `\mathbb`  
 #2 : Input slot(s), *e.g.*, the slot for ‘A’ (comma separated)  
 #3 : Output slot, *e.g.*, the slot for ‘A’  
 Adds `\um_set_mathcode:nnnn` declarations to the specified maths alphabet’s definition (*e.g.*, `\um@mathscr`). Uses `\um@addto@mathmap` (below) to expand the name of the current symbol font.

```

519 \cs_set:Nn \um_mathmap_noparse:Nnn {
520   \clist_map_inline:nn {#2} {
521     \exp_args:No \um@addto@mathmap \um_symfont_tl {##1}{#1}{#3}
522   }
523 }

```

`\um_mathmap_parse:Nnn` #1 : Maths alphabet, *e.g.*, `\mathbb`  
 #2 : Input slot(s), *e.g.*, the slot for ‘A’ (comma separated)  
 #3 : Output slot, *e.g.*, the slot for ‘A’  
 When `\um@parse@term` is executed, it populates the `\um@char@num@range` macro with slot numbers corresponding to the specified range. This range is used to conditionally add `\um_set_mathcode:nnnn` declarations to the maths alphabet definition (*e.g.*, `\um@mathscr`).

```

524 \cs_set:Nn \um_mathmap_parse:Nnn {
525   \clist_map_inline:Nn \um@char@num@range {
526     \ifnum##1=#3\relax
527       \clist_map_inline:nn {#2} {
528         \exp_args:No \um@addto@mathmap \um_symfont_tl {####1}{#1}{#3}
529       }
530     \fi
531   }
532 }

```

`\um@addto@mathmap` #1 : Math symbol font, always/usually the expansion of `\um_symfont_tl`  
 #2 : Input slot, *e.g.*, the slot for ‘A’  
 #3 : Maths alphabet, *e.g.*, `\mathbb`  
 #4 : Output slot, *e.g.*, the slot for ‘A’

This macro is used so that `\um_symfont_t1` can be expanded before entering the `\g@addto@macro` command.

```

533 \newcommand\um@addto@mathmap[4]{
534   \expandafter\g@addto@macro
535     \csname um_setup_\cs_to_str:N #3:\endcsname{
536     \um_set_mathcode:nnnn{#2}{\mathalpha}{#1}{#4}
537   }
538 }
```

## 5.4 (Big) operators

Turns out that  $\text{\XeTeX}$  is clever enough to deal with big operators for us automatically with `\XeTeXmathchardef`. Amazing!

However, the limits aren't set automatically; that is, we want to define, a la Plain  $\text{\TeX}$  *etc.*, `\def\int{\intop\nolimits}`, so there needs to be a transformation from `\int` to `\intop` during the expansion of `\UnicodeMathSymbol` in the appropriate contexts.

Following is a table of every math operator (`\mathop`) defined in `unicode-math-table.tex`, from which a subset need to be flagged for `\nolimits` adjustments. The limits behaviour as specified by `unicode-math` are shown (with grey 'scripts').

usv	Ex.	Macro	Description
U+02140	$\sum\limits_0^1$	<code>\Bbbsum</code>	DOUBLE-STRUCK N-ARY SUMMATION
U+0220F	$\prod\limits_0^1$	<code>\prod</code>	PRODUCT OPERATOR

U+02A21		<code>\zproject</code>	Z NOTATION SCHEMA PROJECTION
U+02AFC		<code>\biginterleave</code>	LARGE TRIPLE VERTICAL BAR OPERATOR
U+02AFF		<code>\bigtalloblong</code>	N-ARY WHITE VERTICAL BAR

`\um@nolimits` This macro is a sequence containing those maths operators that require a `\nolimits` suffix. This list is used when processing `unicode-math-table.tex` to define such commands automatically (see the macro `\um@set@mathsymbol` on page 18). I’ve chosen essentially just the operators that look like integrals; hopefully a better mathematician can help me out here. I’ve a feeling that it’s more useful *not* to include the multiple integrals such as , but that might be a matter of preference.

```

539 \def\um@nolimits{
540   \@elt\int\@elt\iint\@elt\iiint\@elt\iiint\@elt\oint\@elt\oiint\@elt\oiint
541   \@elt\intclockwise\@elt\varointclockwise\@elt\ointctrclockwise\@elt\sumint
542   \@elt\intbar\@elt\intBar\@elt\fint\@elt\cirfnint\@elt\awint\@elt\rppolint

```

```

543 \@elt\scpolint\@elt\npolint\@elt\pointint\@elt\sqint\@elt\intlarhk\@elt\intx
544 \@elt\intcap\@elt\intcup\@elt\upint\@elt\lowint
545 }

```

`\addnolimits` This macro appends material to the macro containing the list of operators that don't take limits. See example following for usage. Note at present that this command must have taken effect before `\setmathfont`.

```

546 \newcommand\addnolimits[1]{
547   \expandafter\def\expandafter\um@nolimits\expandafter{\um@nolimits\@elt#1}
548 }

```

`\removenolimits` Can this macro be given a better name? It removes (globally) an item from the `nolimits` list. See example following for usage.

```

549 \def\removenolimits#1{
550   \begingroup
551     \def\@elt##1{
552       \ifx##1#1\else
553         \noexpand\@elt\noexpand##1
554       \fi}
555     \xdef\um@nolimits{\um@nolimits}
556   \endgroup
557 }

```

---

$$\iiint_V \iiint_V \iiint_V$$

```

\def\dmath#1{\displaystyle #1}
\setmathfont{Cambria Math} \dmath{\iiint_V}
\removenolimits\iiint
\setmathfont{Cambria Math} \dmath{\iiint_V}
\addnolimits\iiint
\setmathfont{Cambria Math} \dmath{\iiint_V}

```

---

## 5.5 Radicals

The radical for square root is organised in `\um@set@mathsymbol` on page ?? . I think it's the only radical ever. (Actually, there is also `\cuberoot` and `\fourthroot`, but they don't seem to behave as proper radicals.)

Also, what about right-to-left square roots?

`\um@radicals` We organise radicals in the same way as `nolimits`-operators; that is, in a comma-list.

```

558 \def\um@radicals{\sqrt}

```

---

```
\setmathfont{Cambria Math}
\l[ \sqrt{1+\sqrt{1+
\sqrt{1+ \sqrt{1+
\sqrt{1+\sqrt{1+
\sqrt{1+x}}}}}} \l]
```

---

```
\setmathfont{Cambria Math}
\l[ \sqrt[2]{1+\sqrt[3]{1+x}} \l]
```

---

5.6 Delimiters

\left We redefine the primitive to be preceded by \mathopen; this gives much better spacing in cases such as \sin\left.... Courtesy of Frank Mittelbach:  
http://www.latex-project.org/cgi-bin/ltxbugs2html?pr=latex/3853&prlatex/3754

```
559 \let\left@primitive\left
560 \def\left{\mathopen{}\left@primitive}
```

No re-definition is made for \right because I don't believe it to be necessary.  
: TODO : 'fences', e.g., \vert

---

```
\setmathfont{Cambria Math}
\l[ \left(\left(\left(\left(\left(\left( x
\right)^1\right)^2\right)^3\right)^4\right)^5 \l]
\l[ \left[\left[\left[\left[\left[\left[ y
\right]^1\right]^2\right]^3\right]^4\right]^5 \l]
\l[ \left\{\left\{\left\{\left\{\left\{\left\{ z
\right\}^1\right\}^2\right\}^3\right\}^4\right\}^5 \l]
```

---

Here are all \mathopen characters:

## 6 Font features

`\um@zf@feature` Use the same method as `fontspec` for feature definition (*i.e.*, using `xkeyval`) but with a conditional to restrict the scope of these features to unicode-math commands.

```
561 \newcommand\um@zf@feature[2]{
562   \define@key[zf]{options}{#1}[]{
563     \ifum@fontspec@feature
564       #2
565     \else
566       \PackageError{fontspec/unicode-math}
567         {The ‘#1’ font feature can only be used for maths fonts}
568         {The feature you tried to use can only be in commands
569           like \protect\setmathfont}
570     \fi
571   }
572 }
```

### 6.1 OpenType maths font features

```
573 \um@zf@feature{ScriptStyle}{
574   \zf@update@ff{+ssty=0}
575 }
576 \um@zf@feature{ScriptScriptStyle}{
577   \zf@update@ff{+ssty=1}
578 }
```

### 6.2 Script and scriptscript font options

```
579 \define@cmdkey[um]{options}[um@]{ScriptFeatures}{}
580 \define@cmdkey[um]{options}[um@]{ScriptScriptFeatures}{}
581 \define@cmdkey[um]{options}[um@]{ScriptFont}{}
582 \define@cmdkey[um]{options}[um@]{ScriptScriptFont}{}

```

### 6.3 Range processing

The ‘ALL’ branch here is deprecated and happens automatically.

```
583 \define@choicekey+[um]{options}{Range}[\@tempa\@tempb]{ALL}{
584   \ifcase\@tempb\relax
585     \global\let\um@char@range\empty
586   \fi
587 }{
588   \xdef\um@char@range{#1}
589 }
```

Pretty basic comma separated range processing. Donald Arseneau’s `selectp` package has a cleverer technique.

`\um@parse@term` #1 : unicode character slot  
#2 : control sequence (character macro)  
#3 : control sequence (math type)  
#4 : code to execute  
This macro expands to #4 if any of its arguments are contained in the commalist `\um@char@range`. This list can contain either character ranges (for checking with #1) or control sequences. These latter can either be the command name of a specific character, *or* the math type of one (*e.g.*, `\mathbin`).  
Character ranges are passed to `\um@parse@range`, which accepts input in the form shown in table 10.

Table 10: Ranges accepted by `\um@parse@range`.

Input	Range
$x$	$r = x$
$x-$	$r \geq x$
$-y$	$r \leq y$
$x-y$	$x \leq r \leq y$

Start by iterating over the commalist, ignoring empties, and initialising the scratch conditional:

```

590 \newcommand\um@parse@term[4]{
591   \clist_map_variable:NNn \um@char@range \@ii {
592     \unless\ifx\@ii\@empty
593       \@tempswafalse

```

Match to either the character macro (`\alpha`) or the math type (`\mathbin`):

```

594     \expandafter\um@firstchar\expandafter{\@ii}
595     \ifx\@tempa\um@backslash
596       \expandafter\ifx\@ii#2\relax
597         \@tempswatruetrue
598     \else
599       \expandafter\ifx\@ii#3\relax
600         \@tempswatruetrue
601     \fi
602   \fi

```

Otherwise, we have a number range, which is passed to another macro:

```

603   \else
604     \expandafter\um@parse@range\@ii-\@marker-\@nil#1\@nil
605   \fi

```

If we have a match, execute the code! It also populates the `\um@char@num@range` macro, which is used when defining `\mathbf` (*etc.*) `\mathchar` remappings.

```

606   \if@tempswa
607     \ifx\um@char@num@range\@empty

```

```

608         \g@addto@macro\um@char@num@range{#1}
609     \else
610         \g@addto@macro\um@char@num@range{,#1}
611     \fi
612     #4%
613 \fi
614 \fi
615 }
616 }
617 \def\um@firstof#1#2\@nil{#1}
618 \edef\um@backslash{\expandafter\um@firstof\string\string\@nil}
619 \def\um@firstchar#1{\edef\@tempa{\expandafter\um@firstof\string#1\@nil}}

```

'1' or '\a' or '\b' is included '1' or '\b' or '\c' is  
 included '3' or '\a' or '\b' is included '3' or '\a' or  
 '\b' is included

```

\def\um@char@range{\a,2-4,\c}
\um@parse@term{1}{\a}{\b}
  {'1' or '\string'a' or '\string'b' is included}
\um@parse@term{1}{\b}{\c}
  {'1' or '\string'b' or '\string'c' is included}
\um@parse@term{3}{\a}{\b}
  {'3' or '\string'a' or '\string'b' is included}

```

\um@parse@range Weirid syntax. As shown previously in table 10, this macro can be passed four different input types via \um@parse@term.

```

620 \def\um@parse@range#1-#2-#3\@nil#4\@nil{
621   \def\@tempa{#1}
622   \def\@tempb{#2}

## 7 Maths alphabets mapping definitions

Algorithm for setting alphabet fonts. By default, when Range is empty, we are in *implicit* mode. If Range contains the name of the math alphabet, we are in *explicit* mode and do things slightly differently.

Implicit mode:

- Try and set all of the alphabet shapes.
- Check for the first glyph of the uppercase Latin alphabet to detect if the font supports each alphabet shape. (This doesn't work to distinguish Latin/Greek but we hope all maths fonts will have at least them!)
- For alphabets that do exist, overwrite whatever's already there.
- For alphabets that are not supported, *do nothing*. (This includes leaving the old alphabet definition in place.)

Explicit mode:

- Only set the alphabets specified.
- Check for the first glyph of the uppercase Latin alphabet to detect if the font contains the alphabet shape in the unicode math plane.
- For unicode math alphabets, overwrite whatever's already there.
- Otherwise, use the ASCII letters instead.

```

826 \cs_new:Nn \um_setup_alphabets: {
827   \um_setup_math_alphabet:n {up   }
828   \um_setup_math_alphabet:n {it   }

```

## 7.2 Definitions of the math symbols

Here we define every unicode math codepoint an equivalent macro name. The two are equivalent, in a `\let\xyz=^^^^1234` kind of way.

`\um@scancharlet` We need to do some trickery to transform the `\UnicodeMathSymbol` argument  
`\um@scanactivedef` "ABCDEF into the  $\text{\LaTeX}$  'caret input' form `^^^^^abcdef`. It is *very important* that the argument has five characters. Otherwise we need to change the number of ^ chars.

To do this, turn ^ into a regular 'other' character and define the macro to perform the lowercasing and `\let`. `\scantokens` changes the carets back into their original meaning after the group has ended and ^'s catcode returns to normal.

```
1139 \begingroup
1140   \char_make_other:N \^
1141   \cs_gset:Npn \um@scancharlet#1="#2\@nil {
1142     \lowercase{
1143       \scantokens{\global\let#1=^^^^^#2}
1144     }
1145   }
```

Making ^ the right catcode isn't strictly necessary right now but it helps to future proof us with, e.g., `breqn`.

```
1146   \gdef\um@scanactivedef"#1\@nil#2{
1147     \lowercase{
1148       \tl_rescan:nn{
1149         \char_make_math_superscript:N\^
1150       }{
1151         \global\def^^^^^#1{#2}
1152       }
1153     }
1154   }
1155 \endgroup
```

Now give `\UnicodeMathSymbol` a definition in terms of `\um@scancharlet` and we're good to go.

```
1156 \begingroup
1157   \def\UnicodeMathSymbol#1#2#3#4{
1158     \um@scancharlet#2=#1\@nil
1159   }
1160   \input{unicode-math-table.tex}
1161 \endgroup
```

## 8 Epilogue

Lots of little things to tidy up.

## 8.0.1 Primes

---

$[x']$	$[x''']$	$[x''''']$	<code>\setmathfont{Cambria Math}</code>
$[x']$	$[x''']$	$[x''''']$	<code>[\$x\prime\$] [\$x\prime\prime\prime\$]</code>
$[x']$	$[x''']$	$[x''''']$	<code>[\$x\prime\prime\prime\$] [\$x\prime\prime\prime\prime\prime\$] \~</code>
$[x']$	$[x''']$	$[x''''']$	<code>[\$x'\$] [\$x'''\$] [\$x'''''\$] \~</code>
$[x']$	$[x''']$	$[x''''']$	<code>[\$x\$] [\$x\$] [\$x\$] [\$x\$]</code>

---

We need a new ‘prime’ algorithm. Unicode math has four pre-drawn prime glyphs.

```
U+2032: PRIME (\primesingle): x'
U+2033: DOUBLE PRIME (\primedouble): x''
U+2034: TRIPLE PRIME (\primetriple): x'''
U+2057: QUADRUPLE PRIME (\primequadruple): x''''
```

As you can see, they’re all drawn at the correct height without being superscripted. However, in a correctly behaviour OpenType font with the MATH table, we also see different behaviour after the ssty feature is applied:

```
U+2032: PRIME in the ‘scriptstyle’ font: x'
```

The shrinking and offsetting is done as it is turned into a superscript. This means, luckily, that by default things work nicely for single primes. We can write `x\primesingle` or `x^\primesingle` and get:  $x'$  and  $x'$ . To support single primes, then, things are easier than in  $\text{\LaTeX}$ ; we can just map ‘ to `\prime` and not worry about it.

However, it would be nice to use the pre-composed primes above if they exist in the font; consider  $x'''$  vs.  $x'''$ . Our algorithm is

- Prime encountered; pcount=1.
- Scan ahead; if prime: pcount:=pcount+1; repeat.
- If not prime, stop scanning.
- If pcount=1, `\prime`, end.
- If pcount=2, check `\primedouble`; if it exists, use it, end; if not, goto last step.
- Ditto pcount=3 & `\primetriple`.
- Ditto pcount=4 & `\primequadruple`.
- If pcount>4 or the glyph doesn’t exist, insert pcount `\primes` with `\primekern` between each.

```

1200         \um_scanprime_collect:
1201       }{
1202         \um_nprimes_select:n {\l_um_primecount_num}
1203       }

```

```

1204     }
1205   }
1206 }

1207 \cs_set_eq:NN \prime \um_scanprime:
1208 \group_begin:
1209   \char_make_active:N \'
1210   \char_make_active:n {"2032}
1211   \cs_gset_eq:NN ' \um_scanprime:
1212   \cs_gset_eq:NN ^^^^2032 \um_scanprime:
1213 \group_end:

```

### 8.0.2 Unicode radicals

Undo the damage made to `\sqrt`:

```

1214 \DeclareRobustCommand\sqrt{\@ifnextchar[\@sqrt\sqrtsign}

```

`\r@@t` #1 : A mathstyle (for `\mathpalette`)  
 #2 : Leading superscript for the sqrt sign  
 A re-implementation of L<sup>A</sup>T<sub>E</sub>X's hard-coded n-root sign using the appropriate `\fontdimens`.

```

1215 \def\r@@t#1#2{
1216   \setbox\z@\hbox{$\math #1\sqrtsign{#2}$}
1217   \um@scaled@apply{#1}{\kern}{\fontdimen63\um@font}
1218   \raise \dimexpr(
1219     \um@fontdimen@percent{65}{\um@font}\ht\z@-
1220     \um@fontdimen@percent{65}{\um@font}\dp\z@
1221   )\relax
1222   \copy \rootbox
1223   \um@scaled@apply{#1}{\kern}{\fontdimen64\um@font}
1224   \box \z@
1225 }

```

### 8.0.3 Unicode sub- and super-scripts

The idea here is to enter a scanning state after a superscript or subscript is encountered. If subsequent superscripts or subscripts (resp.) are found, they are lumped together. Each sub/super has a corresponding regular size glyph which is used by X<sub>Y</sub>L<sup>A</sup>T<sub>E</sub>X to typeset the results; this means that the actual subscript/superscript glyphs are never seen in the output document — they are only used as input characters.

Open question: should the superscript-like ‘modifiers’ (U+1D2C: MODIFIER CAPITAL LETTER A and on) be included here?

First, the setup of each mathactive char:

```

1226 \prop_new:N \g_um_supers_prop

```

```

1227 \prop_new:N \g_um_subs_prop
1228 \cs_generate_variant:Nn \prop_gput:Nnn {Nxn}
1229 \cs_generate_variant:Nn \prop_get:NnN {cxN}
1230 \cs_generate_variant:Nn \prop_if_in:NnTF {cx}
1231
1232 \group_begin:
1233
1234 % Populate a property list with superscript characters; their mean-
1235 % ing as their key,
1236 % for reasons that will become apparent soon, and their replace-
1237 % ment as each key's value.
1238 % Then make the superscript active and bind it to the scanning function.
1239 %
1240 % \cs{scantokens} makes this process much simpler since we can acti-
1241 % vate the char
1242 % and assign its meaning in one step.
1243 \cs_set:Nn \um_setup_active_superscript:nn {
1244   \prop_gput:Nxn \g_um_supers_prop {\meaning #1} {#2}

1321     \um_scan_sscript:
1322   }{
1323     \um_sub_or_super:n {\l_um_ss_chain_tl}
1324   }
1325 }
1326
1327 % The main theme here is stolen from the source to the various \cs{peek_} func-
1328 % tions.
1329 % Consider this function as simply boilerplate:
1330 \cs_new:Nn \um_scan_sscript:TF {
1331   \tl_set:Nx \l_peek_true_aux_tl { \exp_not:n{ #1 } }
1332   \tl_set_eq:NN \l_peek_true_tl \c_peek_true_remove_next_tl
1333   \tl_set:Nx \l_peek_false_tl { \exp_not:n{ \group_align_safe_end: #2 } }
1334   \group_align_safe_begin:
1335   \peek_after:NN \um_peek_execute_branches_ss:
1336 }
1337
1338 % We do not skip spaces when scanning ahead, and we explicitly wish to
1339 % bail out on encountering a space or an opening brace.
1340 \cs_new:Npn \um_peek_execute_branches_ss: {
1341   \bool_if:nTF {
1342     \token_if_eq_catcode_p:NN \l_peek_token \c_group_begin_token ||
1343     \token_if_eq_meaning_p:NN \l_peek_token \c_space_token
1344   } { \l_peek_false_tl }
1345   { \um_peek_execute_branches_ss_aux: }
1346 }
1347
1348 % This is the actual comparison code.
1349 % Because the peeking has already tokenised the next token,
1350 % it's too late to extract its charcode directly. Instead,
1351 % we look at its meaning, which remains a 'character' even
1352 % though it is itself math-active. If the character is ever
1353 % made fully active, this will break our assumptions!
1354 %
1355 % If the char's meaning exists as a property list key, we
1356 % build up a chain of sub-/superscripts and iterate. (If not, exit and
1357 % typeset what we've already collected.)
1358 \cs_new:Nn \um_peek_execute_branches_ss_aux: {
1359   \prop_if_in:cxTF
1360     {g_um_\l_um_tmpa_tl _prop}

```

```

1361     {\meaning\l_peek_token}
1362     {
1363       \prop_get:cxN
1364       {g_um_\l_um_tmpa_tl _prop}
1365       {\meaning\l_peek_token}
1366       \l_um_tmpb_tl
1367       \tl_put_right:NV \l_um_ss_chain_tl \l_um_tmpb_tl
1368       \l_peek_true_tl
1369     }
1370     {\l_peek_false_tl}
1371   }

```

## 8.0.4 Synonyms and all the rest

We need to change L<sup>A</sup>T<sub>E</sub>X's idea of the font used to typeset things like `\sin` and `\cos`:

```

1372 \def\operator@font{\um_setup_mathup:}
1373 \def\to{\rightarrow}
1374 \def\le{\leq}
1375 \def\ge{\geq}
1376 \def\neq{\neq}

```

`\mathcal`

```

1377 \def\mathcal{\mathscr}

```

`\mathrm`

```

1378 \def\mathrm{\mathup}

```

## 8.0.5 Compatibility

Note that `amsmath` will always be loaded before `unicode-math`. (Conflicts occur if you try it the other way around.)

- Since the mathcode of `\-` is greater than eight bits, this piece of `\AtBeginDocument` code from `amsmath` dies if we try and set the maths font in the preamble:

```

1379 \ifpackageloaded{amsmath}{
1380   \tl_remove_in:Nn \@begindocumenthook {
1381     \mathchardef\std@minus\mathcode`\-\relax
1382     \mathchardef\std@equal\mathcode`\=\relax
1383   }
1384 }{}

```

- This code is to improve the output of alphabetic symbols in text of operator names (`\sin`, `\cos`, etc.). Just comment out the offending lines for now:

```

1385 \ifpackageloaded{amsopn}{
1386   \cs_set:Npn \newmcodes@ {
1387     \mathcode`\'39
1388     \mathcode`\*42
1389     \mathcode`\."613A%
1390   % \ifnum\mathcode`\-45 \else
1391   %   \mathchardef\std@minus\mathcode`\-\relax
1392   % \fi
1393   \mathcode`\-45
1394   \mathcode`\-/47
1395   \mathcode`\:"603A\relax
1396 }
1397 }{}

```

Overriding amsmath definitions:

```

1398 \AtBeginDocument{
1399   \def\@cdots{\mathinner{\cdots}}
1400 }

```

Interaction with beamer:

```

1401 \ifclassloaded{beamer}{
1402   \ifbeamer@suppressreplacements\else
1403     \PackageWarningNoLine{unicode-math}{
1404       Disabling~ beamer's~ math~ setup.^J
1405       Please~ load~ beamer~ with~ the~ [professionalfonts]~ class~ option
1406     }
1407     \beamer@suppressreplacementstrue
1408   \fi
1409 }{}

```

The end.

```

1410 \ExplSyntaxOff

```

## File II

# STIX table data extraction

The source for the  $\TeX$  names for the very large number of mathematical glyphs are provided via Barbara Beeton's table file for the stix project ([ams.org/STIX](http://ams.org/STIX)). A version is located at <http://www.ams.org/STIX/bnb/stix-tbl.asc> but check <http://www.ams.org/STIX/> for more up-to-date info.

This table is converted into a form suitable for reading by  $\XeTeX$ , and then hand-edited by the author; the result is `unicode-math-table.tex`.

A single file is produced containing all (more than 3298) symbols. Future optimisations might include generating various (possibly overlapping) subsets so

```
1 #!/bin/sh
2
3 cat stix-tbl.txt |
4 awk '
```

```
5 {if (usv != substr($0,2,5) && substr($0,2,1) != " ")
6     {usv = substr($0,2,5);
7     texname = substr($0,84,25);
8     class = substr($0,57,1);
9     description = tolower(substr($0,233,350));
```

```

10     if (texname ~ /[\\]/ &&
11         substr(texname,0,5) != "\\text" &&
12         substr(texname,0,4) != "\\ipa" &&
13         substr(texname,0,5) != "\\tone" &&
14         substr(texname,3,1) != " " &&
15         class != " " &&
16         description !~ /<reserved>/ )

```

```

17     print "\\UnicodeMathSymbol{"\" \" \
18         usv "}" \" \
19         texname "}" \" \
20         class "}" \" \
21         description "%";
22 }' - |

```

```
23 sed -e ' s/{N}/{\\mathord}/ ' \
```

```

24 -e ' s/{F}/{\\mathord}/ ' \
25 -e ' s/{A}/{\\mathalpha}/ ' \
26 -e ' s/{D}/{\\mathaccent}/ ' \
27 -e ' s/{P}/{\\mathpunct}/ ' \
28 -e ' s/{B}/{\\mathbin}/ ' \
29 -e ' s/{R}/{\\mathrel}/ ' \
30 -e ' s/{L}/{\\mathop}/ ' \
31 -e ' s/{O}/{\\mathopen}/ ' \
32 -e ' s/{C}/{\\mathclose}/ ' \

```

Fixing up a couple of things in the STIX table.

```
33      -e ' s/\^/\string^/ ' > unicode-math.tex
```

## A Documenting maths support in the NFSS

### A.1 Overview

In the following,  $\langle NFSS\ decl.\rangle$  stands for something like  $\{\mathrm{T1}\}\{\mathrm{lmr}\}\{\mathrm{m}\}\{\mathrm{n}\}$ .

**Maths symbol fonts** Fonts for symbols:  $\alpha, \leq, \rightarrow$

```
\DeclareSymbolFont{\langle name\rangle}\langle NFSS decl.\rangle
```

Declares a named maths font such as operators from which symbols are defined with `\DeclareMathSymbol`.

**Maths alphabet fonts** Fonts for  $ABC-xyz, \mathfrak{ABC}-\mathcal{XYZ}$ , etc.

```
\DeclareMathAlphabet{\langle cmd\rangle}\langle NFSS decl.\rangle
```

For commands such as `\mathbf`, accessed through maths mode that are unaffected by the current text font, and which are used for alphabetic symbols in the ASCII range.

```
\DeclareSymbolFontAlphabet{\langle cmd\rangle}\{\langle name\rangle\}
```

Alternative (and optimisation) for `\DeclareMathAlphabet` if a single font is being used for both alphabetic characters (as above) and symbols.

**Maths ‘versions’** Different maths weights can be defined with the following, switched in text with the `\mathversion{\langle maths version\rangle}` command.

```
\SetSymbolFont{\langle name\rangle}\{\langle maths version\rangle}\langle NFSS decl.\rangle
```

```
\SetMathAlphabet{\langle cmd\rangle}\{\langle maths version\rangle}\langle NFSS decl.\rangle
```

**Maths symbols** Symbol definitions in maths for both characters (=) and macros (`\eqdef`): `\DeclareMathSymbol{\langle symbol\rangle}\{\langle type\rangle\}\{\langle named font\rangle\}\{\langle slot\rangle\}` This is the macro that actually defines which font each symbol comes from and how they behave.

Delimiters and radicals use wrappers around TeX’s `\delimiter/\radical` primitives, which are re-designed in XeTeX. The syntax used in LaTeX’s NFSS is therefore not so relevant here.

**Delimiters** A special class of maths symbol which enlarge themselves in certain contexts.

```
\DeclareMathDelimiter{\langle symbol\rangle}\{\langle type\rangle\}\{\langle sym. font\rangle\}\{\langle slot\rangle\}\{\langle sym. font\rangle\}\{\langle slot\rangle\}
```

**Radicals** Similar to delimiters (`\DeclareMathRadical` takes the same syntax) but behave ‘weirdly’. `\sqrt` might very well be the only one.

In those cases, glyph slots in *two* symbol fonts are required; one for the small (‘regular’) case, the other for situations when the glyph is larger. This is not the case in X<sub>Y</sub>TeX.

Accents are not included yet.

**Summary** For symbols, something like:

```
\def\DeclareMathSymbol#1#2#3#4{
  \global\mathchardef#1"\mathchar@type#2
  \expandafter\hexnumber@\csname sym#2\endcsname
  {\hexnumber@{\count\z@}\hexnumber@{\count\tw@}}}
```

For characters, something like:

```
\def\DeclareMathSymbol#1#2#3#4{
  \global\mathcode`#1"\mathchar@type#2
  \expandafter\hexnumber@\csname sym#2\endcsname
  {\hexnumber@{\count\z@}\hexnumber@{\count\tw@}}}
```

## File III

# X<sub>Y</sub>TeX math font dimensions

These are the extended `\fontdimen` available for suitable fonts in X<sub>Y</sub>TeX. Note that LuaTeX takes an alternative route, and this package will eventually provide a wrapper interface to the two (I hope).

<code>\fontdimen</code>	Dimension name	Description
10	<code>SCRIPTPERCENTSCALEDOWN</code>	Percentage of scaling down for script level 1. Suggested value: 80%.
11	<code>SCRIPTSCRIPTPERCENTSCALEDOWN</code>	Percentage of scaling down for script level 2 (ScriptScript). Suggested value: 60%.
12	<code>DELIMITEDSUBFORMULAMINHEIGHT</code>	Minimum height required for a delimited expression to be treated as a subformula. Suggested value: normal line height $\times$ 1.5.
13	<code>DISPLAYOPERATORMINHEIGHT</code>	Minimum height of n-ary operators (such as integral and summation) for formulas in display mode.

\fontdimen	Dimension name	Description
14	MATHLEADING	White space to be left between math formulas to ensure proper line spacing. For example, for applications that treat line gap as a part of line ascender, formulas with ink going above (os2.sTypoAscender + os2.sTypoLineGap – MathLeading) or with ink going below os2.sTypoDescender will result in increasing line height.
15	AXISHEIGHT	Axis height of the font.
16	ACCENTBASEHEIGHT	Maximum (ink) height of accent base that does not require raising the accents. Suggested: x-height of the font (os2.sxHeight) plus any possible overshoots.
17	FLATTENEDACCENTBASE-HEIGHT	Maximum (ink) height of accent base that does not require flattening the accents. Suggested: cap height of the font (os2.sCapHeight).
18	SUBSCRIPTSHIFTDOWN	The standard shift down applied to subscript elements. Positive for moving in the downward direction. Suggested: os2.ySubscriptYOffset.
19	SUBSCRIPTTOPMAX	Maximum allowed height of the (ink) top of subscripts that does not require moving subscripts further down. Suggested: $\frac{1}{5}$ x-height.
20	SUBSCRIPTBASELINEDROPMIN	Minimum allowed drop of the baseline of subscripts relative to the (ink) bottom of the base. Checked for bases that are treated as a box or extended shape. Positive for subscript baseline dropped below the base bottom.
21	SUPERSCRIPSHIFTUP	Standard shift up applied to superscript elements. Suggested: os2.ySuperscriptYOffset.
22	SUPERSCRIPSHIFTUPCRAMPED	Standard shift of superscripts relative to the base, in cramped style.
23	SUPERSCRIPBOTTOMMIN	Minimum allowed height of the (ink) bottom of superscripts that does not require moving subscripts further up. Suggested: $\frac{1}{4}$ x-height.

\fontdimen	Dimension name	Description
24	SUPERSCRIPTBASELINEDROP-MAX	Maximum allowed drop of the baseline of superscripts relative to the (ink) top of the base. Checked for bases that are treated as a box or extended shape. Positive for superscript baseline below the base top.
25	SUBSUPERSCRIPGAPMIN	Minimum gap between the superscript and subscript ink. Suggested: 4×default rule thickness.
26	SUPERSCRIPBTOTTOMMAX-WITHSUBSCRIPT	The maximum level to which the (ink) bottom of superscript can be pushed to increase the gap between superscript and subscript, before subscript starts being moved down. Suggested: /5 x-height.
27	SPACEAFTERSCRIPT	Extra white space to be added after each subscript and superscript. Suggested: 0.5pt for a 12 pt font.
28	UPPERLIMITGAPMIN	Minimum gap between the (ink) bottom of the upper limit, and the (ink) top of the base operator.
29	UPPERLIMITBASELINERISEMIN	Minimum distance between baseline of upper limit and (ink) top of the base operator.
30	LOWERLIMITGAPMIN	Minimum gap between (ink) top of the lower limit, and (ink) bottom of the base operator.
31	LOWERLIMITBASELINEDROP-MIN	Minimum distance between baseline of the lower limit and (ink) bottom of the base operator.
32	STACKTOPSHIFTUP	Standard shift up applied to the top element of a stack.
33	STACKTOPDISPLAYSTYLESHIFT-UP	Standard shift up applied to the top element of a stack in display style.
34	STACKBOTTOMSHIFTDOWN	Standard shift down applied to the bottom element of a stack. Positive for moving in the downward direction.
35	STACKBOTTOMDISPLAYSTYLE-SHIFTDOWN	Standard shift down applied to the bottom element of a stack in display style. Positive for moving in the downward direction.

\fontdimen	Dimension name	Description
36	STACKGAPMIN	Minimum gap between (ink) bottom of the top element of a stack, and the (ink) top of the bottom element. Suggested: 3×default rule thickness.
37	STACKDISPLAYSTYLEGAPMIN	Minimum gap between (ink) bottom of the top element of a stack, and the (ink) top of the bottom element in display style. Suggested: 7×default rule thickness.
38	STRETCHSTACKTOPSHIFTUP	Standard shift up applied to the top element of the stretch stack.
39	STRETCHSTACKBOTTOMSHIFT-DOWN	Standard shift down applied to the bottom element of the stretch stack. Positive for moving in the downward direction.
40	STRETCHSTACKGAPABOVEMIN	Minimum gap between the ink of the stretched element, and the (ink) bottom of the element above. Suggested: UpperLimitGapMin
41	STRETCHSTACKGAPBELOWMIN	Minimum gap between the ink of the stretched element, and the (ink) top of the element below. Suggested: LowerLimitGapMin.
42	FRACTIONNUMERATORSHIFTUP	Standard shift up applied to the numerator.
43	FRACTIONNUMERATOR-DISPLAYSTYLESHIFTUP	Standard shift up applied to the numerator in display style. Suggested: StackTopDisplayStyleShiftUp.
44	FRACTIONDENOMINATORSHIFT-DOWN	Standard shift down applied to the denominator. Positive for moving in the downward direction.
45	FRACTIONDENOMINATOR-DISPLAYSTYLESHIFTDOWN	Standard shift down applied to the denominator in display style. Positive for moving in the downward direction. Suggested: StackBottomDisplayStyleShiftDown.
46	FRACTIONNUMERATORGAP-MIN	Minimum tolerated gap between the (ink) bottom of the numerator and the ink of the fraction bar. Suggested: default rule thickness

\fontdimen	Dimension name	Description
47	FRACTIONNUMDISPLAYSTYLE-GAPMIN	Minimum tolerated gap between the (ink) bottom of the numerator and the ink of the fraction bar in display style. Suggested: 3×default rule thickness.
48	FRACTIONRULETHICKNESS	Thickness of the fraction bar. Suggested: default rule thickness.
49	FRACTIONDENOMINATORGAP-MIN	Minimum tolerated gap between the (ink) top of the denominator and the ink of the fraction bar. Suggested: default rule thickness
50	FRACTIONDENOMDISPLAY-STYLEGAPMIN	Minimum tolerated gap between the (ink) top of the denominator and the ink of the fraction bar in display style. Suggested: 3×default rule thickness.
51	SKEWEDFRACTION-HORIZONTALGAP	Horizontal distance between the top and bottom elements of a skewed fraction.
52	SKEWEDFRACTIONVERTICAL-GAP	Vertical distance between the ink of the top and bottom elements of a skewed fraction.
53	OVERBARVERTICALGAP	Distance between the overbar and the (ink) top of the base. Suggested: 3×default rule thickness.
54	OVERBARRULETHICKNESS	Thickness of overbar. Suggested: default rule thickness.
55	OVERBAREXTRAASCENDER	Extra white space reserved above the overbar. Suggested: default rule thickness.
56	UNDERBARVERTICALGAP	Distance between underbar and (ink) bottom of the base. Suggested: 3×default rule thickness.
57	UNDERBARRULETHICKNESS	Thickness of underbar. Suggested: default rule thickness.
58	UNDERBAREXTRADESCENDER	Extra white space reserved below the underbar. Always positive. Suggested: default rule thickness.
59	RADICALVERTICALGAP	Space between the (ink) top of the expression and the bar over it. Suggested: 1¼ default rule thickness.

\fontdimen	Dimension name	Description
60	RADICALDISPLAYSTYLE- VERTICALGAP	Space between the (ink) top of the expression and the bar over it. Suggested: default rule thickness + $\frac{1}{4}$ x-height.
61	RADICALRULETHICKNESS	Thickness of the radical rule. This is the thickness of the rule in designed or constructed radical signs. Suggested: default rule thickness.
62	RADICALEXTRAASCENDER	Extra white space reserved above the radical. Suggested: RadicalRuleThickness.
63	RADICALKERNBEFOREDEGREE	Extra horizontal kern before the degree of a radical, if such is present. Suggested: 5/18 of em.
64	RADICALKERNAFTERDEGREE	Negative kern after the degree of a radical, if such is present. Suggested: $-10/18$ of em.
65	RADICALDEGREEBOTTOM- RAISEPERCENT	Height of the bottom of the radical degree, if such is present, in proportion to the ascender of the radical sign. Suggested: 60%.

## File IV

# Some manner of unit testing

Some of the examples in the documentation are actually set up as unit tests, where multiple maths alphabets are placed on top of each other to ensure that various input methods result in the same output.

## B The regular weight alphabets

For regular weight alphabets, we test the resolution from upright/italic math source to unified-shape output.

```

1 \(*test)
2 \documentclass{article}
3 \usepackage[a6paper]{geometry}
4 \usepackage{fontspec}
5 \setmainfont{FPL Neu}
6 \usepackage{unicode-math}
7 \def\upLatin{ABCDEFGHIJKLMNOPQRSTUVWXYZ}
8 \def\uplatin{abcdefghijklmnopqrstuvwxyz}

```

```

9 \def\upGreek{ }
10 \def\upgreek{ }
11 \def\itLatin{ }
12 \def\itlatin{ }
13 \def\itGreek{ }
14 \def\itgreek{ }
15 \def\testmath#1{%
16   \makebox[\linewidth][l]{%
17     \makebox[0pt][l]{$\csname up#1\endcsname$}%
18     \makebox[0pt][l]{$\csname it#1\endcsname$}}
19 \begin{document}
20 \setmathfont[Colour=2255FF99]{Asana Math}
21 \parindent=0pt
22 \voffset=-1in
23 \hoffset=-1in
24 \setbox0=\vbox{%
25   \testmath{Latin}\\
26   \testmath{latin}\\
27   \testmath{Greek}\\
28   \testmath{greek}}
29 \dimen0=\ht0
30 \advance\dimen0\dp0
31 \edef\papersize{papersize=\the\wd0,\the\dimen0}
32 \setbox255=\vbox{\special{\papersize}\box0}
33 \shipout\box255
34 \end{document}
35 \end{test}

```

We need three unit tests to produce the three variations of the math-style option. I'm guessing `literal` is working just fine, but it really needs a different test.

## C The bold alphabets

For bold alphabets, it's a bit more complex. We also test literal bold to the bold produced from markup.

```

36 \begin{testbf}
37 \documentclass{article}
38 \usepackage[a6paper]{geometry}
39 \usepackage{fontspec}
40 \setmainfont{FPL Neu}
41 \usepackage{unicode-math}
42 \def\upLatin{ABCDEFGHIJKLMNOPQRSTUVWXYZ}
43 \def\uplatin{abcdefghijklmnopqrstuvwxyz}
44 \def\upGreek{ }

```

```

45 \def\upgreek{                                }
