

Experimental unicode mathematical typesetting: The unicode-math package

Will Robertson

2010/06/01 v0.5

Abstract

Warning! This package is experimental and subject to change without regard for backwards compatibility. Performance issues may be encountered until algorithms are refined.

This package is intended to be a complete implementation of unicode maths for \LaTeX using the \XeTeX (and later, \LuaTeX) typesetting engines. With this package, changing maths fonts will be as easy as changing text fonts — not that there are many unicode maths fonts yet.

Maths input is simplified with unicode since literal glyphs may be entered instead of control sequences.

1 Introduction

This document describes the unicode-math package, which is an *experimental* implementation of a macro to unicode glyph encoding for mathematical characters. Its intended use is for \XeTeX , although it is conjectured that some effect could be spent to create a cross-format package that would also work with $\text{Lua}\TeX$.

Users who desire to specify maths alphabets only (Greek and Latin letters) may wish to use Andrew Moschou's mathspec package instead.

2 Acknowledgements

Many thanks to Microsoft for developing OpenType math as part of Office 2007; Jonathan Kew for implementing unicode math support in $\text{Xe}\TeX$; Barbara Beeton for her prodigious effort compiling the definitive list of unicode math glyphs and their $\text{L}\TeX$ names (inventing them where necessary), and also for her thoughtful replies to my sometimes incessant questions. Ross Moore and Chris Rowley have provided moral and technical support from the very early days with great insight into the issues we face trying to extend and use \TeX in the future. Apostolos Syropoulos, Joel Salomon, Khaled Hosny, and Mariusz Wodzicki have been fantastic beta testers.

3 Getting started

Load unicode-math as a regular $\text{L}\TeX$ package. It should be loaded after any other maths or font-related package in case it needs to overwrite their definitions. Here's an example:

```
\usepackage{amsmath} % if desired
\usepackage{unicode-math}
\setmathfont{Cambria Math}
```

3.1 Package options

Package options may be set when the package is loaded or at any later stage with the `\unimathsetup` command. Therefore, the following two examples are equivalent:

```
\usepackage[math-style=TeX]{unicode-math}
% OR
\usepackage{unicode-math}
\unimathsetup{math-style=TeX}
```

Table 1: Package options.

Option	Description	See...
<code>math-style</code>	Style of letters	section §5.1
<code>bold-style</code>	Style of bold letters	section §5.2
<code>sans-style</code>	Style of sans serif letters	section §5.3
<code>nabla</code>	Style of the nabla symbol	section §5.5.1
<code>partial</code>	Style of the partial symbol	section §5.5.2
<code>vargreek-shape</code>	Style of phi and epsilon	section §5.5.3
<code>colon</code>	Behaviour of <code>\colon</code>	section §5.5.6
<code>slash-delimiter</code>	Glyph to use for ‘stretchy’ slash	section §5.5.7

Note, however, that some package options affects how maths is initialised and changing an option such as `math-style` will not take effect until a new maths font is set up.

Package options may *also* be used when declaring new maths fonts, passed via options to the `\setmathfont` command. Therefore, the following two examples are equivalent:

```
\unimathsetup{math-style=TeX}
\setmathfont{Cambria Math}
% OR
\setmathfont[math-style=TeX]{Cambria Math}
```

A short list of package options is shown in table 1. See following sections for more information.

4 Unicode maths font setup

In the ideal case, a single unicode font will contain all maths glyphs we need. The file `unicode-math-table.tex` (based on Barbara Beeton’s `stix` table) provides the mapping between unicode maths glyphs and macro names (all 3298 — or however many — of them!). A single command

```
\setmathfont[⟨font features⟩]{⟨font name⟩}
```

implements this for every every symbol and alphabetic variant. That means `x` to x , `\xi` to ξ , `\leq` to \leq , etc., `\mathcal{H}` to \mathcal{H} and so on, all for unicode glyphs within a single font.

This package deals well with unicode characters for maths input. This includes using literal Greek letters in formulae, resolving to upright or italic depending on preference.

Font features specific to `unicode-math` are shown in table 2. Package options (see table 1) may also be used. Other `fontspec` features are also valid.

Table 2: Maths font options.

Option	Description	See...
<code>range</code>	Style of letters	section §4.1
<code>script-font</code>	Font to use for sub- and super-scripts	section §4.2
<code>script-features</code>	Font features for sub- and super-scripts	section §4.2
<code>sscript-font</code>	Font to use for nested sub- and super-scripts	section §4.2
<code>sscript-features</code>	Font features for nested sub- and super-scripts	section §4.2

4.1 Using multiple fonts

There will probably be few cases where a single unicode maths font suffices (simply due to glyph coverage). The upcoming `srix` font comes to mind as a possible exception. It will therefore be necessary to delegate specific unicode ranges of glyphs to separate fonts:

```
\setmathfont[range=<unicode range>,<font features>]{<font name>}
```

where *<unicode range>* is a comma-separated list of unicode slots and ranges such as `{"27D0-"27EB", "27FF", "295B-"297F"}`. You may also use the macro for accessing the glyph, such as `\int`, or whole collection of symbols with the same math type, such as `\mathopen`, or complete math alphabets such as `\mathbb`. (Only numerical slots, however, can be used in ranged declarations.)

4.1.1 Control over maths alphabets

Exact control over maths alphabets can be somewhat involved. Here is the current plan.

- `[range=\mathbb]` to use the font for ‘bb’ letters only.
- `[range=\mathbfssfit/{greek,Greek}]` for Greek lowercase and uppercase only (with `latin`, `Latin`, `num` as well for Latin lower-/upper-case and numbers).
- `[range=\mathsf->\mathbfssfit]` to map to different output alphabet(s) (which is rather useless right now but will become less useless in the future).

And now the trick. If a particular math alphabet is not defined in the font, fall back onto the lower-base plane (i.e., upright) glyphs. Therefore, to use an ASCII-encoded fractur font, for example, write

```
\setmathfont[range=\mathfrak]{SomeFrakturFont}
```

and because the math plane fractur glyphs will be missing, unicode-math will know to use the ASCII ones instead. If necessary (but why?) this behaviour can be forced with `[range=\mathfrac->\mathup]`.

4.2 Script and scriptscript fonts/features

Cambria Math uses OpenType font features to activate smaller optical sizes for scriptsize and scriptscriptsize symbols (the B and C , respectively, in A_{B_C}). Other fonts will possibly use entirely separate fonts.

Not yet implemented: Both of these options must be taken into account. I hope this will be mostly automatic from the users' points of view. The `+ssty` feature can be detected and applied automatically, and appropriate optical size information embedded in the fonts will ensure this latter case. Fine tuning should be possible automatically with `fontspec` options. We might have to wait until MnMath, for example, before we really know.

5 Maths input

X_YTeX's unicode support allows maths input through two methods. Like classical TeX, macros such as `\alpha`, `\sum`, `\pm`, `\leq`, and so on, provide verbose access to the entire repertoire of characters defined by unicode. The literal characters themselves may be used instead, for more readable input files.

5.1 Math 'style'

Classically, TeX uses italic lowercase Greek letters and *upright* uppercase Greek letters for variables in mathematics. This is contrary to the iso standards of using italic forms for both upper- and lowercase. Furthermore, the French (contrary again, *quelle surprise*) have been known to use upright uppercase *Latin* letters as well as upright upper- and lowercase Greek. Finally, it is not unknown to use upright letters for all characters, as seen in the Euler fonts.

The unicode-math package accommodates these possibilities with an interface heavily inspired by Walter Schmidt's `lucimatx` package: a package option `math-style` that takes one of four arguments: `TeX`, `ISO`, `french`, or `upright`.

The philosophy behind the interface to the mathematical alphabet symbols lies in L^ATeX's attempt of separating content and formatting. Because input source text may come from a variety of places, the upright and 'mathematical' italic Latin and Greek alphabets are *unified* from the point of view of having a specified meaning in the source text. That is, to get a mathematical ' x ', either the `ascii` ('keyboard') letter `x` may be typed, or the actual unicode character may be used. Similarly for Greek letters. The upright or italic forms are then chosen based on the `math-style` package option.

If glyphs are desired that do not map as per the package option (for example, an upright ' g ' is desired but typing `g` yields ' g '), *markup* is required to specify this; to follow from the example: `\mathup{g}`. Maths alphabets commands such as `\mathup` are detailed later.

Table 3: Effects of the `math-style` package option.

Package option	Example	
	Latin	Greek
<code>math-style=ISO</code>	(a, z, B, X)	$(\alpha, \beta, \Gamma, \Xi)$
<code>math-style=TeX</code>	(a, z, B, X)	$(\alpha, \beta, \Gamma, \Xi)$
<code>math-style=french</code>	(a, z, B, X)	$(\alpha, \beta, \Gamma, \Xi)$
<code>math-style=upright</code>	(a, z, B, X)	$(\alpha, \beta, \Gamma, \Xi)$

Alternative interface However, some users may not like this convention of normalising their input. For them, an upright x is an upright ‘ x ’ and that’s that. (This will be the case when obtaining source text from copy/pasting PDF or Microsoft Word documents, for example.) For these users, the `literal` option to `math-style` will effect this behaviour.

The `math-style` options’ effects are shown in brief in table 3.

5.2 Bold style

Similar as in the previous section, ISO standards differ somewhat to \TeX ’s conventions (and classical typesetting) for ‘boldness’ in mathematics. In the past, it has been customary to use bold *upright* letters to denote things like vectors and matrices. For example, $\mathbf{M} = (M_x, M_y, M_z)$. Presumably, this was due to the relatively scarcity of bold italic fonts in the pre-digital typesetting era. It has been suggested that *italic* bold symbols are used nowadays instead.

Bold Greek letters have simply been bold variant glyphs of their regular weight, as in $\xi = (\xi_r, \xi_\varphi, \xi_\theta)$. Confusingly, the syntax in \LaTeX has been different for these two examples: `\mathbf{f}` in the former (‘ \mathbf{M} ’), and `\bm` (or `\boldsymbol`, deprecated) in the latter (‘ ξ ’).

In `unicode-math`, the `\mathbf{f}` command works directly with both Greek and Latin maths alphabet characters and depending on package option either switches to upright for Latin letters (`bold-style=TeX`) as well or keeps them italic (`bold-style=ISO`).

To match the package options for non-bold characters, for `bold-style=upright` all bold characters are upright, and `bold-style=literal` does not change the upright/italic shape of the letter.

Upright and italic bold mathematical letters input as direct unicode characters are normalised with the same rules. For example, with `bold-style=TeX`, a literal bold italic latin character will be typeset upright.

Note that `bold-style` is independent of `math-style`, although if the former is not specified then sensible defaults are chosen based on the latter.

The `bold-style` options’ effects are shown in brief in table 4.

Table 4: Effects of the `bold-style` package option.

Package option	Example	
	Latin	Greek
<code>bold-style=ISO</code>	$(\boldsymbol{a}, \boldsymbol{z}, \boldsymbol{B}, \boldsymbol{X})$	$(\boldsymbol{\alpha}, \boldsymbol{\beta}, \boldsymbol{\Gamma}, \boldsymbol{\Xi})$
<code>bold-style=TeX</code>	$(\boldsymbol{a}, \boldsymbol{z}, \boldsymbol{B}, \boldsymbol{X})$	$(\boldsymbol{\alpha}, \boldsymbol{\beta}, \boldsymbol{\Gamma}, \boldsymbol{\Xi})$
<code>bold-style=upright</code>	$(\boldsymbol{a}, \boldsymbol{z}, \boldsymbol{B}, \boldsymbol{X})$	$(\boldsymbol{\alpha}, \boldsymbol{\beta}, \boldsymbol{\Gamma}, \boldsymbol{\Xi})$

5.3 Sans serif style

Unicode contains upright and italic, medium and bold mathematical alphabet characters. These may be explicitly selected with the `\mathsfup`, `\mathsfit`, `\mathbfsup`, and `\mathbfsfit` commands discussed in section §5.4.

How should the generic `\mathsf` behave? Unlike bold, sans serif is used much more sparingly in mathematics. I’ve seen recommendations to typeset tensors in sans serif italic or sans serif italic bold (e.g., examples in the `isomath` and `mattens` packages). But L^AT_EX’s `\mathsf` is *upright* sans serif.

Therefore I reluctantly add the package options `[sans-style=upright]` and `[sans-style=italic]` to control the behaviour of `\mathsf`. The `upright` style sets up the command to use the seemingly-useless upright sans serif, including Greek; the `italic` style switches to using italic in both Latin and Greek alphabets. In other words, this option simply changes the meaning of `\mathsf` to either `\mathsfup` or `\mathsfit`, respectively. Please let me know if more granular control is necessary here.

There is also a `[sans-style=literal]` setting, set automatically with `[math-style=literal]`, which retains the uprightness of the input characters used when selecting the sans serif output.

5.3.1 What about bold sans serif?

While you might want your bold upright and your sans serif italic, I don’t believe you’d also want your bold sans serif upright (or all vice versa, if that’s even conceivable). Therefore, bold sans serif follows from the setting for sans serif; it is completely independent of the setting for bold.

In other words, `\mathbfsf` is `\mathbfsup` or `\mathbfsfit` based on `[sans-style=upright]` or `[sans-style=italic]`, respectively. And `[sans-style=literal]` causes `\mathbfsf` to retain the same italic or upright shape as the input, and turns it bold sans serif.

Note well! There is no medium-weight sans serif Greek alphabet in unicode; therefore, `\mathsf{\alpha}` does not make sense (simply produces ‘ α ’) while `\mathbfsf{\alpha}` gives ‘ α ’.

Table 5: Mathematical alphabets defined in unicode. Black dots indicate an alphabet exists in the font specified; grey dots indicate shapes that should always be taken from the upright font even in the italic style. See main text for description of `\mathbbit`.

Font				Alphabet

5.4 All (the rest) of the mathematical alphabets

Unicode contains separate codepoints for most if not all variations of alphabet shape one may wish to use in mathematical notation. The complete list is shown in table 5. Some of these have been covered in the previous sections.

At present, the math font switching commands do not nest; therefore if you want sans serif bold, you must write `\mathsfbf{...}` rather than `\mathbf{\mathsf{...}}`. This may change in the future.

5.4.1 Double-struck

The double-struck alphabet (also known as ‘blackboard bold’) consists of upright Latin letters $\{a-z, A-Z\}$, numerals $\mathbb{0}-\mathbb{9}$, summation symbol $\mathbb{\Sigma}$, and four Greek letters only: $\{\mathbb{V}, \mathbb{W}, \mathbb{F}, \mathbb{M}\}$.

While `\mathbb{\sum}` does produce a double-struck summation symbol, its limits aren’t properly aligned (see section §??). Therefore, either the literal character or the control sequence `\Bbbsum` are recommended instead.

There are also five Latin *italic* double-struck letters: $\mathbb{D}, \mathbb{d}, \mathbb{E}, \mathbb{e}, \mathbb{J}$. These can be accessed (if not with their literal characters or control sequences) with the `\mathbbit`

Table 6: The various forms of nabla.

Description		Glyph
Upright	Serif	∇
	Bold serif	∇
	Bold sans	∇
Italic	Serif	∇
	Bold serif	∇
	Bold sans	∇

alphabet switch, but note that only those five letters will give the expected output.

5.5 Miscellanea

5.5.1 Nabla

The symbol ∇ comes in the six forms shown in table 6. We want an individual option to specify whether we want upright or italic nabla by default (when either upright or italic nabla is used in the source). \TeX classically uses an upright nabla, but iso standards differ (I think). The package options `nabla=upright` and `nabla=italic` switch between the two choices, and `nabla=literal` respects the shape of the input character. This is then inherited through `\mathbf`; `\mathit` and `\mathup` can be used to force one way or the other.

`nabla=italic` is implicit when using `math-style=ISO` and `nabla=upright` follows both `math-style=TeX` and `math-style=french`. `nabla=literal` is activated by default after `math-style=literal`.

5.5.2 Partial

The same applies to the symbols `u+2202` partial differential and `u+1D715` math italic partial differential.

At time of writing, both the Cambria Math and STIX fonts display these two glyphs in the same italic style, but this is hopefully a bug that will be corrected in the future — the ‘plain’ partial differential should really have an upright shape.

Use the `partial=upright` or `partial=italic` package options to specify which one you would like, or `partial=literal` to have the same character used in the output as was used for the input. The default is (always, unless someone requests and argues otherwise) `partial=italic`.¹ `partial=literal` is activated following `math-style=literal`.

See table 7 for the variations on the partial differential symbol.

¹A good argument would revolve around some international standards body recommending upright over italic. I just don’t have the time right now to look it up.

Table 7: The various forms of the partial differential. Note that in the fonts used to display these glyphs, the first upright partial is incorrectly shown in an italic style.

Description		Glyph
Regular	Upright	∂
	Italic	∂
Bold	Upright	∂
	Italic	∂
Sans bold	Upright	∂
	Italic	∂

5.5.3 Epsilon and phi: ε vs. ϵ and φ vs. ϕ

\TeX defines `\epsilon` to look like ϵ and `\varepsilon` to look like ε . The Unicode glyph directly after delta and before zeta is ‘epsilon’ and looks like ε ; there is a subsequent variant of epsilon that looks like ϵ . This creates a problem. People who use unicode input won’t want their glyphs transforming; \TeX users will be confused that what they think as ‘normal epsilon’ is actual the ‘variant epsilon’. And the same problem exists for ‘phi’.

We have a package option to control this behaviour. With `\vargreek-shape=TeX`, `\phi` and `\epsilon` produce ϕ and ε and `\varphi` and `\varepsilon` produce ϕ and ϵ . With `\vargreek-shape=unicode`, these symbols are swapped. Note, however, that unicode characters are not affected by this option. That is, no remapping occurs of the characters/glyphs, only the control sequences.

The package default is to use `\vargreek-shape=TeX`.

5.5.4 Primes

Primes (x') may be input in several ways. You may use any combination of ASCII straight quote (‘), unicode prime U+2032 (’), and `\prime`; when multiple primes occur next to each other, they chain together to form double, triple, or quadruple primes if the font contains pre-drawn glyphs. These may also be accessed with `\dprime`, `\trprime`, and `\qprime`, respectively.

If the font does not contain the pre-drawn glyphs or more than four primes are used, the single prime glyph is used multiple times with a negative kern to get the spacing right. There is no user interface to adjust this negative kern yet (because I haven’t decided what it should look like); if you need to, write something like this:

```
\ExplSyntaxOn
\muskip_gset:Nn \g_um_primekern_muskip { -\thinmuskip/2 }
\ExplSyntaxOff
```

A 0 1 2 3 4 5 6 7 8 9 + - = () i n Z

Figure 1: The unicode superscripts supported as input characters. These are the literal glyphs from Charis SIL, not the output seen when used for maths input. The ‘A’ and ‘Z’ are to provide context for the size and location of the superscript glyphs.

A 0 1 2 3 4 5 6 7 8 9 + - = () a e i o r u v x β γ ρ φ χ Z

Figure 2: The unicode subscripts supported as input characters. See note from figure 1.

Backwards or reverse primes behave in exactly the same way; use any of `ASCII` back tick (```), unicode reverse prime `U+2035` (`'`), or `\backprime` to access it. Multiple backwards primes can also be called with `\backdprime`, `\backtrprime`, and `\backqprime`.

If you ever need to enter the straight quote `'` or the backtick ``` in maths mode, these glyphs can be accessed with `\mathstraightquote` and `\mathbacktick`.

5.5.5 Unicode subscripts and superscripts

You may, if you wish, use unicode subscripts and superscripts in your source document. For basic expressions, the use of these characters can make the input more readable. Adjacent sub- or super-scripts will be concatenated into a single expression.

The range of subscripts and superscripts supported by this package are shown in figures 1 and 2. Please request more if you think it is appropriate.

5.5.6 Colon

The colon is one of the few confusing characters of unicode maths. In \TeX , `:` is defined as a colon with relation spacing: `'a : b'`. While `\colon` is defined as a colon with punctuation spacing: `'a:b'`.

In unicode, `U+003A` colon is defined as a punctuation symbol, while `U+2236` ratio is the colon-like symbol used in mathematics to denote ratios and other things.

This breaks the usual straightforward mapping from control sequence to unicode input character to (the same) unicode glyph.

To preserve input compatibility, we remap the `ASCII` input character `':'` to `U+2236`. Typing a literal `U+2236` char will result in the same output. If `amsmath` is loaded, then the definition of `\colon` is inherited from there (it looks like a

Table 8: Slashes and backslashes.

Slot	Name	Glyph	Command
U+002F	SOLIDUS	/	<code>\slash</code>
U+2044	FRACTION SLASH	/	<code>\fracslash</code>
U+2215	DIVISION SLASH	/	<code>\divslash</code>
U+29F8	BIG SOLIDUS	/	<code>\xsol</code>
U+005C	REVERSE SOLIDUS	\	<code>\backslash</code>
U+2216	SET MINUS	\	<code>\smallsetminus</code>
U+29F5	REVERSE SOLIDUS OPERATOR	\	<code>\setminus</code>
U+29F9	BIG REVERSE SOLIDUS	\	<code>\xbsol</code>

punctuation colon with additional space around it). Otherwise, `\colon` is made to output a colon with `\mathpunct` spacing.

The package option `colon=literal` forces ASCII input ‘:’ to be printed as `\mathcolon` instead.

5.5.7 Slashes and backslashes

There are several slash-like symbols defined in unicode. The complete list is shown in table 8.

In regular \LaTeX we can write `\left\slash...\right\backslash` and so on and obtain extensible delimiter-like symbols. Not all of the unicode slashes are suitable for this (and do not have the font support to do it).

Slash Of U+2044 fraction slash, TR25 says that it is:

...used to build up simple fractions in running text...however parsers of mathematical texts should be prepared to handle fraction slash when it is received from other sources.

U+2215 division slash should be used when division is represented without a built-up fraction; $\pi \approx 22/7$, for example.

U+29F8 big solidus is a ‘big operator’ (like Σ).

Backslash The U+005C reverse solidus character `\backslash` is used for denoting double cosets: $A \backslash B$. (So I’m led to believe.) It may be used as a ‘stretchy’ delimiter if supported by the font.

MathML uses U+2216 set minus like this: $A \setminus B$.² The \LaTeX command name `\smallsetminus` is used for backwards compatibility.

²§4.4.5.11 <http://www.w3.org/TR/MathML3/>

Presumably, u+29F5 reverse solidus operator is intended to be used in a similar way, but it could also (perhaps?) be used to represent ‘inverse division’: $\pi \approx 7 \setminus 22$.³ The L^AT_EX name for this character is `\setminus`.

Finally, u+29F9 big reverse solidus is a ‘big operator’ (like Σ).

How to use all of these things Unfortunately, font support for the above characters/glyphs is rather inconsistent. In Cambria Math, the only slash that grows (say when writing

$$\left[\begin{array}{cc} a & b \\ c & d \end{array} \right] \bigg/ \left[\begin{array}{cc} 1 & 1 \\ 1 & 0 \end{array} \right] \quad)$$

is the `FRACTION SLASH`, which we just established above is sort of only supposed to be used in text.

Of the above characters, the following are allowed to be used after `\left`, `\middle`, and `\right`:

- `\solidus`;
- `\fracslash`;
- `\slash`; and,
- `\backslash` (the only reverse slash).

However, we assume that there is only *one* stretchy slash in the font; this is assumed by default to be u+002F solidus. Writing `\left/` or `\left\slash` or `\leftfracslash` will all result in the same stretchy delimiter being used.

The delimiter used can be changed with the `slash-delimiter` package option. Allowed values are `ascii`, `frac`, and `div`, corresponding to the respective unicode slots.

For example: as mentioned above, Cambria Math’s stretchy slash is u+2044 fraction slash. When using Cambria Math, then `unicode-math` should be loaded with the `slash-delimiter=frac` option. (This should be a font option rather than a package option, but it will change soon.)

5.5.8 Pre-drawn fraction characters

Pre-drawn fractions u+00BC – u+00BE , u+2150 – u+215E are not suitable for use in mathematics output. However, they can be useful as input characters to abbreviate common fractions.

$\frac{1}{4}$ $\frac{1}{2}$ $\frac{3}{4}$ $\frac{1}{3}$ $\frac{2}{3}$ $\frac{1}{5}$ $\frac{2}{5}$ $\frac{3}{5}$ $\frac{4}{5}$ $\frac{1}{6}$ $\frac{5}{6}$ $\frac{1}{8}$ $\frac{3}{8}$ $\frac{5}{8}$ $\frac{7}{8}$

For example, instead of writing ‘`\tfrac{12}{x}`’, it’s more readable to have ‘ $\frac{12}{x}$ ’ in the source instead.

³This is valid syntax in the Octave and Matlab programming languages, in which it means matrix inverse pre-multiplication. I.e., $A \setminus B \equiv A^{-1}B$.

U+2B24	<code>\lgbkcircle</code>	●	◯	<code>\lgwhtcircle</code>	U+25EF

Table 9: Filled and hollow unicode circles.

If the `\tfrac` command exists (i.e., if `amsmath` is loaded or you have specially defined `\tfrac` for this purpose), it will be used to typeset the fractions. If not, regular `\frac` will be used. The command to use (`\tfrac` or `\frac`) can be forced either way with the package option `active-frac=small` or `active-frac=normalsize`, respectively.

5.5.9 Circles

Unicode defines a large number of different types of circles for a variety of mathematical purposes. There are thirteen alone just considering the all white and all black ones, shown in table 9.

L^AT_EX defines considerably fewer: `\circ` and `\bigcirc` for white; `\bullet` for black. This package maps those commands to `\vysmwhtcircle`, `\mdlgwhtcircle`, and `\smbkcircle`, respectively.

5.5.10 Triangles

While there aren't as many different sizes of triangle as there are circle, there's some important distinctions to make between a few similar characters. Namely, Δ and \triangle and Δ and Δ . See table 10 for the full summary.

These triangles all have different intended meanings. Note for backwards compatibility with T_EX, U+25B3 has *two* different mappings in unicode-math. `\bigtriangleup` is intended as a binary operator whereas `\triangle` is intended to be used as a letter-like symbol.

But you're better off if you're using the latter form to indicate an increment to use the glyph intended for this purpose: Δx .

Finally, given that Δ and Δ are provided for you already, it is better off to only use upright Greek Delta Δ if you're actually using it as a symbolic entity such as a variable on its own.

Slot	Command	Glyph	Class
U+25B5	<code>\vartriangle</code>	\triangle	binary
U+25B3	<code>\bigtriangleup</code>	\bigtriangleup	binary
U+25B3	<code>\triangle</code>	\triangle	ordinary
U+2206	<code>\increment</code>	Δ	ordinary
U+0394	<code>\mathup\Delta</code>	Δ	ordinary

Table 10: Different upwards pointing triangles.

5.5.11 Normalising some input characters

I believe all variant forms should be used as legal input that is normalised to a consistent output glyph, because we want to be fault-tolerant in the input. Here are the duplicates:

U+251 latin small letter alpha
 U+25B latin small letter epsilon
 U+263 latin small letter gamma
 U+269 latin small letter iota
 U+278 latin small letter phi
 U+28A latin small letter upsilon
 U+190 latin capital letter epsilon
 U+194 latin capital letter gamma
 U+196 latin capital letter iota
 U+1B1 latin capital letter upsilon

(Not yet implemented.)

526   \restore@mathversion\init@restore@version\dorestore@version\process@table
527   \new@mathversion\DeclareSymbolFont\group@list\group@elt
528   \new@symbolfont\SetSymbolFont\SetSymbolFont@get@cdp
529   \DeclareMathAlphabet\new@mathalphabet\SetMathAlphabet\SetMathAlphabet@
530   \DeclareMathAccent\set@mathaccent\DeclareMathSymbol\set@mathchar
531   \set@mathsymbol\DeclareMathDelimiter\@xxDeclareMathDelimiter
532   \@DeclareMathDelimiter\@xDeclareMathDelimiter\set@mathdelimiter
533   \set@@mathdelimiter\DeclareMathRadical\mathchar@type
534   \DeclareSymbolFontAlphabet\DeclareSymbolFontAlphabet@
535 }{
536   \tl_remove_in:Nn \@preamblecmds {\do#1}
537 }

```

7 Fundamentals

7.1 Enlarging the number of maths families

To start with, we’ve got a power of two as many `\fams` as before. So (from `ltxssbas.dtx`) we want to redefine

```

538 \def\new@mathgroup{\alloc@8\mathgroup\chardef\@cclvi}
539 \let\newfam\new@mathgroup

```

This is sufficient for L^AT_EX’s `\DeclareSymbolFont`-type commands to be able to define 256 named maths fonts.

7.2 Setting math chars, math codes, etc.

`\um_set_mathsymbol:nNNn #1` : A L^AT_EX symbol font, e.g., operators

#2 : Symbol macro, *e.g.*, `\alpha`

#3 : Type, *e.g.*, `\mathalpha`

#4 : Slot, *e.g.*, "221E

There are a bunch of tests to perform to process the various characters. The following assignments should all be fairly straightforward.

```
540 \cs_set:Npn \um_set_mathsymbol:nNNn #1#2#3#4 {
541   \prg_case_tl:Nnn #3 {
542     \mathop {
543       \um_set_big_operator:nnn {#1} {#2} {#4}
544     }
545     \mathopen {
546       \tl_if_in:NnTF \l_um_radicals_tl {#2} {
547         \cs_gset:cpx {\cs_to_str:N #2 sign} { \um_radical:nn {#1} {#4} }
548       }{
549         \um_set_delcode:n {#4}
550         \um_set_mathcode:nnn {#4} \mathopen {#1}
551         \cs_gset:Npx #2 { \um_delimiter:Nnn \mathopen {#1} {#4} }
552       }
553     }
554     \mathclose {
555       \um_set_delcode:n {#4}
556       \um_set_mathcode:nnn {#4} \mathclose {#1}
557       \cs_gset:Npx #2 { \um_delimiter:Nnn \mathclose {#1} {#4} }
558     }
559     \mathfence {
560       \um_set_mathcode:nnn {#4} {#3} {#1}
561       \um_set_delcode:n {#4}
562       \cs_gset:cpx {l \cs_to_str:N #2} { \um_delimiter:Nnn \math-
open {#1} {#4} }
563       \cs_gset:cpx {r \cs_to_str:N #2} { \um_delimiter:Nnn \math-
close {#1} {#4} }
564     }
565     \mathaccent {
566       \cs_gset:Npx #2 { \um_accent:Nnn #3 {#1} {#4} }
567     }
568   }{
569     \um_set_mathcode:nnn {#4} {#3} {#1}
570   }
571 }
```

`\um_set_big_operator:nnn` #1 : Symbol font name

#2 : Macro to assign

#3 : Glyph slot

In the examples following, say we're defining for the symbol `\sum`(Σ). In order for literal unicode characters to be used in the source and still have the correct limits behaviour, big operators are made math-active. This involves three steps:

- The active math char is defined to expand to the macro `\sum_sym`. (Later, the control sequence `\sum` will be assigned the math char.)
- Declare the plain old `mathchardef` for the control sequence `\sumop`. (This follows the convention of $\text{\LaTeX}/\text{amsmath}$.)
- Define `\sum_sym` as `\sumop`, followed by `\nolimits` if necessary.

Whether the `\nolimits` suffix is inserted is controlled by the token list `\l_um_nolimits_tl`, which contains a list of such characters. This list is checked dynamically to allow it to be updated mid-document.

Examples of expansion, by default, for two big operators:

$(\sum \rightarrow) \Sigma \rightarrow \sum_sym \rightarrow \sumop\nolimits$
 $(\int \rightarrow) \int \rightarrow \int_sym \rightarrow \intop$

```

611 }

```

7.3 The main `\setmathfont` macro

Using a range including large character sets such as `\mathrel`, `\mathalpha`, *etc.*, is *very slow*! I hope to improve the performance somehow.

`\setmathfont` [**#1**]: font features
#2 : font name

```

612 \cs_new:Npn \um_init: {

```

- Erase any conception \LaTeX has of previously defined math symbol fonts; this allows `\DeclareSymbolFont` at any point in the document.

```

613   \let\glb@currsizel\relax

```

- To start with, assume we’re defining the font for every math symbol character.

```

614   \bool_set_true:N \l_um_init_bool
615   \seq_clear:N \l_um_char_range_seq
616   \clist_clear:N \l_um_char_num_range_clist
617   \seq_clear:N \l_um_mathalpha_seq
618   \clist_clear:N \l_um_unknown_keys_clist

```

```

619 }
620 \DeclareDocumentCommand \setmathfont { 0{ } m } {
621   \um_init:

```

- Grab the current size information (is this robust enough? Maybe it should be preceded by `\normalsize`).

```

622   \csname S@\f@size\endcsname

```

- Set the name of the math version being defined. (obviously more needs to be done here!)

```
623 \tl_set:Nn \l_um_mversion_tf {normal}
624 \DeclareMathVersion{\l_um_mversion_tf}
```

Define default font features for the script and scriptscript font.

```
625 \tl_set:Nn \l_um_script_features_tl {ScriptStyle}
626 \tl_set:Nn \l_um_sscript_features_tl {ScriptScriptStyle}
627 \tl_set:Nn \l_um_script_font_tl {#2}
628 \tl_set:Nn \l_um_sscript_font_tl {#2}
```

Use fontspec to select a font to use. The macro `\S@{size}` contains the definitions of the sizes used for maths letters, subscripts and subsubscripts in `\tf@size`, `\sf@size`, and `\ssf@size`, respectively.

```
629 \keys_set:nn {unicode-math} {#1}
630 \um_fontspec_select_font:n {#2}
```

Check for the correct number of `\fontdimens`:

```
631 %% \ifdim \dimexpr\fontdimen9\l_um_font*65536\relax =65pt\relax
632 %% \bool_set_true:N \l_um_ot_math_bool
633 %% \else
634 %% \bool_set_false:N \l_um_ot_math_bool
635 %% \PackageWarningNoLine{unicode-math}{
636 %% The~ font~ '#2' ~is~ not~ a~ valid~ OpenType~ maths~ font.~
637 %% Some~ maths~ features~ will~ not~ be~ available~ or~ behave~
638 %% in~ a~ substandard~ manner
639 %% }
640 %% \fi
```

If we're defining the full unicode math repertoire, then we skip all the parsing processing needed if we're only defining a subset.

- Math symbols are defined with `\UnicodeMathSymbol`; see section §7.3.1 for the individual definitions

```
641 \bool_if:NTF \l_um_init_bool {
642 \tl_set:Nn \um_symfont_tl {um_allsym}
643 \msg_trace:nxx {unicode-math} {default-math-font} {#2}
644 \cs_set_eq:NN \UnicodeMathSymbol \um_process_symbol_noparse:nnnn
645 \cs_set_eq:NN \um_set_mathalphabet_char:Nnn \um_mathmap_noparse:Nnn
646 \cs_set_eq:NN \um_remap_symbol:nnn \um_remap_symbol_noparse:nnn
647 \cs_set_eq:NN \um_maybe_init_alphabet:n \um_init_alphabet:n
648 \cs_set_eq:NN \um_map_char_single:nn \um_map_char_noparse:nn
649 }{
650 \int_incr:N \g_um_fam_int
651 \tl_set:Nx \um_symfont_tl {um_fam\int_use:N\g_um_fam_int}
652 \cs_set_eq:NN \UnicodeMathSymbol \um_process_symbol_parse:nnnn
653 \cs_set_eq:NN \um_set_mathalphabet_char:Nnn \um_mathmap_parse:Nnn
```

```

654 \cs_set_eq:NN \um_remap_symbol:nnn \um_remap_symbol_parse:nnn
655 \cs_set_eq:NN \um_maybe_init_alphabet:n \use_none:n
656 \cs_set_eq:NN \um_map_char_single:nn \um_map_char_parse:nn
657 }

```

Now defined `\um_symfont_t1` as the \LaTeX math font to access everything:

```

658 \DeclareSymbolFont{\um_symfont_t1}
659 {\encodingdefault}{\zf@family}{\mddefault}{\updefault}

```

And now we input every single maths char. See File 13 for the source to `unicode-math.tex` which is used to create `unicode-math-table.tex`.

```

660 \@input{unicode-math-table.tex}
661 \cs_set_eq:NN \UnicodeMathSymbol \use_none:nnnn

```

Finally,

- Remap symbols that don't take their natural mathcode
- Activate any symbols that need to be math-active
- Assign delimiter codes for symbols that need to grow
- Setup the maths alphabets (`\mathbf` etc.)

```

662 \um_remap_symbols:
663 \um_setup_mathactives:
664 \um_setup_delcodes:
665 \um_setup_alphabets:

```

Prevent spaces:

```

666 \ignorespaces
667 }

```

`\um_fontspec_select_font:` Select the font with `\fontspec` and define `\l_um_font` from it.

```

668 \cs_new:Npn \um_fontspec_select_font:n #1 {
669 \bool_set_true:N \l_um_fontspec_feature_bool
670 \fontspec_select:xn
671 {
672 BoldFont = {}, ItalicFont = {},
673 Script = Math,
674 SizeFeatures = {
675 {Size = \tf@size-} ,
676 {Size = \sf@size-\tf@size ,
677 Font = \l_um_script_font_t1 ,
678 \l_um_script_features_t1
679 } ,
680 {Size = -\sf@size ,
681 Font = \l_um_sscript_font_t1 ,
682 \l_um_sscript_features_t1

```

```

683     }
684   },
685   \l_um_unknown_keys_clist
686 }
687 {#1}
688 \tl_set_eq:NN \l_um_font \zf@basefont
689 \bool_set_false:N \l_um_fontspec_feature_bool
690 }

```

7.3.1 Functions for setting up symbols with mathcodes

`\um_process_symbol_noparse:nnnn` If the range font feature has been used, then only a subset of the unicode glyphs
`\um_process_symbol_parse:nnnn` are to be defined. See section §8.3 for the code that enables this.

```

691 \cs_set:Npn \um_process_symbol_noparse:nnnn #1#2#3#4 {
692   \um_set_mathsymbol:nNNn {\um_symfont_tl} #2#3{#1}
693 }
694 \cs_set:Npn \um_process_symbol_parse:nnnn #1#2#3#4 {
695   \um@parse@term{#1}{#2}{#3}{
696     \um_process_symbol_noparse:nnnn{#1}{#2}{#3}{#4}
697   }
698 }

```

`\um_remap_symbols:` This function is used to define the mathcodes for those chars which should be
`\um_remap_symbol_noparse:nnn` mapped to a different glyph than themselves.
`\um_remap_symbol_parse:nnn`

```

699 \cs_new:Npn \um_remap_symbols: {
700   \um_remap_symbol:nnn{`-}{\mathbin}{"02212}% hyphen to minus
701   \um_remap_symbol:nnn{`*}{\mathbin}{"02217}% text asterisk to "cen-
       tred asterisk"
702   \bool_if:NF \g_um_literal_colon_bool {
703     \um_remap_symbol:nnn{`:}{\mathrel}{"02236}% colon to ratio (i.e., punct to rel)
704   }
705 }

```

Where `\um_remap_symbol:nnn` is defined to be one of these two, depending on the range setup:

```

706 \cs_new:Npn \um_remap_symbol_parse:nnn #1#2#3 {
707   \um@parse@term {#3} {\@nil} {#2} {
708     \um_remap_symbol_noparse:nnn {#1} {#2} {#3}
709   }
710 }
711 \cs_new:Npn \um_remap_symbol_noparse:nnn #1#2#3 {
712   \clist_map_inline:nn {#1} {
713     \um_set_mathcode:nnnn {##1} {#2} {\um_symfont_tl} {#3}
714   }
715 }

```

7.3.2 Active math characters

There are more math active chars later in the subscript/superscript section. But they don't need to be able to be typeset directly.

`\um_setup_mathactives:`

```
716 \cs_new:Npn \um_setup_mathactives: {  
717   \um_make_mathactive:nNN {"2032} \um_prime_single_mchar \mathord  
718   \um_make_mathactive:nNN {"2033} \um_prime_double_mchar \mathord  
719   \um_make_mathactive:nNN {"2034} \um_prime_triple_mchar \mathord  
720   \um_make_mathactive:nNN {"2057} \um_prime_quad_mchar \mathord  
721   \um_make_mathactive:nNN {"2035} \um_backprime_single_mchar \mathord  
722   \um_make_mathactive:nNN {"2036} \um_backprime_double_mchar \mathord  
723   \um_make_mathactive:nNN {"2037} \um_backprime_triple_mchar \mathord  
724   \um_make_mathactive:nNN {\`'} \mathstraightquote \mathord  
725   \um_make_mathactive:nNN {\`\`} \mathbacktick \mathord  
726 }
```

`\um_make_mathactive:nNN` : TODO : hook into range feature Makes #1 a mathactive char, and gives cs #2 the meaning of mathchar #1 with class #3. You are responsible for giving active #1 a particular meaning!

```
727 \cs_new:Npn \um_make_mathactive:nNN #1#2#3 {  
728   \um_set_mathchar:NNnn #2 #3 {\um_symfont_t1} {#1}  
729   \char_gmake_mathactive:n {#1}  
730 }
```

7.3.3 Delimiter codes

Some symbols that aren't mathopen/mathclose still need to have delimiter codes assigned. The list of vertical arrows may be incomplete. On the other hand, many fonts won't support them all being stretchy. And some of them are probably not meant to stretch, either. But adding them here doesn't hurt.

`\um_setup_delcodes:`

```
731 \cs_new:Npn \um_setup_delcodes: {  
732   \um_set_delcode:nn {\`\/} {\g_um_slash_delimiter_usv}  
733   \um_set_delcode:nn {"2044} {\g_um_slash_delimiter_usv} % fracslash  
734   \um_set_delcode:nn {"2215} {\g_um_slash_delimiter_usv} % divslash  
735   \um_set_delcode:n {"005C} % backslash  
736   \um_set_delcode:nn {\`<} {"27E8} % angle brackets with ascii notation  
737   \um_set_delcode:nn {\`>} {"27E9} % angle brackets with ascii notation  
738   \um_set_delcode:n {"2191} % up arrow  
739   \um_set_delcode:n {"2193} % down arrow  
740   \um_set_delcode:n {"2195} % updown arrow  
741   \um_set_delcode:n {"219F} % up arrow twohead  
742   \um_set_delcode:n {"21A1} % down arrow twohead
```

```

743 \um_set_delcode:n {"21A5} % up arrow from bar
744 \um_set_delcode:n {"21A7} % down arrow from bar
745 \um_set_delcode:n {"21A8} % updown arrow from bar
746 \um_set_delcode:n {"21BE} % up harpoon right
747 \um_set_delcode:n {"21BF} % up harpoon left
748 \um_set_delcode:n {"21C2} % down harpoon right
749 \um_set_delcode:n {"21C3} % down harpoon left
750 \um_set_delcode:n {"21C5} % arrows up down
751 \um_set_delcode:n {"21F5} % arrows down up
752 \um_set_delcode:n {"21C8} % arrows up up
753 \um_set_delcode:n {"21CA} % arrows down down
754 \um_set_delcode:n {"21D1} % double up arrow
755 \um_set_delcode:n {"21D3} % double down arrow
756 \um_set_delcode:n {"21D5} % double updown arrow
757 \um_set_delcode:n {"21DE} % up arrow double stroke
758 \um_set_delcode:n {"21DF} % down arrow double stroke
759 \um_set_delcode:n {"21E1} % up arrow dashed
760 \um_set_delcode:n {"21E3} % down arrow dashed
761 \um_set_delcode:n {"21E7} % up white arrow
762 \um_set_delcode:n {"21E9} % down white arrow
763 \um_set_delcode:n {"21EA} % up white arrow from bar
764 \um_set_delcode:n {"21F3} % updown white arrow
765 }

```

`\um_set_delcode:nn` : TODO : hook into range feature

```

\um_set_delcode:n 766 \cs_new:Npn \um_set_delcode:nn #1#2 {
767   \Udelcode#1 = \csname sym\um_symfont_tl\endcsname #2
768 }
769 \cs_new:Npn \um_set_delcode:n #1 {
770   \Udelcode#1 = \csname sym\um_symfont_tl\endcsname #1
771 }

```

7.3.4 Maths alphabets' character mapping

7.3.5 Functions for setting up the maths alphabets

`\um_mathmap_noparse:Nnn` #1 : Maths alphabet, *e.g.*, `\mathbb`
 #2 : Input slot(s), *e.g.*, the slot for 'A' (comma separated)
 #3 : Output slot, *e.g.*, the slot for 'A'
 Adds `\um_set_mathcode:nnnn` declarations to the specified maths alphabet's definition.

```

772 \cs_set:Npn \um_mathmap_noparse:Nnn #1#2#3 {
773   \clist_map_inline:nn {#2} {
774     \tl_put_right:cx {um_switchto_\cs_to_str:N #1:} {
775       \um_set_mathcode:nnnn{##1}{\mathalpha}{\um_symfont_tl}{#3}
776     }

```

```

777 }
778 }

```

`\um_mathmap_parse:Nnn` #1 : Maths alphabet, *e.g.*, `\mathbb`
#2 : Input slot(s), *e.g.*, the slot for ‘A’ (comma separated)
#3 : Output slot, *e.g.*, the slot for ‘A’
When `\um@parse@term` is executed, it populates the `\l_um_char_num_range_clist` macro with slot numbers corresponding to the specified range. This range is used to conditionally add `\um_set_mathcode:nnnn` declarations to the maths alphabet definition.

```

779 \cs_set:Npn \um_mathmap_parse:Nnn #1#2#3 {
780   \clist_if_in:NnT \l_um_char_num_range_clist {#3} {
781     \um_mathmap_noparse:Nnn {#1}{#2}{#3}
782   }
783 }

```

7.4 (Big) operators

Turns out that \LaTeX is clever enough to deal with big operators for us automatically with `\Umathchardef`. Amazing!

However, the limits aren’t set automatically; that is, we want to define, a la Plain \TeX *etc.*, `\def\int{\intop\nolimits}`, so there needs to be a transformation from `\int` to `\intop` during the expansion of `\UnicodeMathSymbol` in the appropriate contexts.

Following is a table of every math operator (`\mathop`) defined in `unicode-math-table.tex`, from which a subset need to be flagged for `\nolimits` adjustments. The limits behaviour as specified by `unicode-math` are shown (with grey ‘scripts’).

USV	Ex.	Macro	Description
U+GOBBLE"02140	$\sum\limits_0^1$	<code>\Bbbsum</code>	DOUBLE-STRUCK N-ARY SUMMATION
U+GOBBLE"0220F	$\prod\limits_0^1$	<code>\prod</code>	PRODUCT OPERATOR
U+GOBBLE"02210	$\coprod\limits_0^1$	<code>\coprod</code>	COPRODUCT OPERATOR

U+GOBBLE"02AFF		\bigtalloblong	N-ARY WHITE VERTICAL BAR

`\l_um_nolimits_tl` This macro is a sequence containing those maths operators that require a `\nolimits` suffix. This list is used when processing `unicode-math-table.tex` to define such commands automatically (see the macro `\um_set_mathsymbol:nNNn`). I've chosen essentially just the operators that look like integrals; hopefully a better mathematician can help me out here. I've a feeling that it's more useful *not* to in-

clude the multiple integrals such as \iiint , but that might be a matter of preference.

```

784 \tl_new:Nn \l_um_nolimits_tl {
785   \int\iint\iiint\iiiint\oint\oiint\oiiint
786   \intclockwise\varointclockwise\ointctrclockwise\sumint
787   \intbar\intBar\oint\circfnint\awint\rppoint
788   \scpolint\npolint\pointint\sqint\intlarhk\intx
789   \intcap\intcup\upoint\lowint
790 }

```

`\addnolimits` This macro appends material to the macro containing the list of operators that don't take limits.

```

791 \DeclareDocumentCommand \addnolimits {m} {
792   \tl_put_right:Nn \l_um_nolimits_tl {#1}
793 }

```

`\removenolimits` Can this macro be given a better name? It removes an item from the nolimits list.

```

794 \DeclareDocumentCommand \removenolimits {m} {
795   \tl_remove_all_in:Nn \l_um_nolimits_tl {#1}
796 }

```

7.5 Radicals

The radical for square root is organised in `\um_set_mathsymbol:nNNn` on page ?? . I think it's the only radical ever. (Actually, there is also `\cuberoot` and `\fourthroot`, but they don't seem to behave as proper radicals.)

Also, what about right-to-left square roots?

`\um@radicals` We organise radicals in the same way as nolimits-operators; that is, in a comma-list.

```

797 \tl_new:Nn \l_um_radicals_tl {\sqrt}

```

$$\sqrt[2]{1 + \sqrt[3]{1+x}}$$

```

\setmathfont{Cambria Math}
\[ \sqrt[2]{1+\sqrt[3]{1+x}} \]

```

7.6 Delimiters

`\left` We redefine the primitive to be preceded by `\mathopen`; this gives much better spacing in cases such as `\sin\left...` . Courtesy of Frank Mittelbach:

<http://www.latex-project.org/cgi-bin/ltxbugs2html?pr=latex/3853&prlatex/3754>

```

798 \let\left@primitive\left
799 \def\left{\mathopen{}\left@primitive}

```

No re-definition is made for `\right` because it's not necessary.

Here are all `\mathopen` characters:

7.7 Maths accents

Maths accents should just work *if they are available in the font*.

USV	Ex.	Macro	Description
-----	-----	-------	-------------

8 Font features

`\um@zf@feature` Use the same method as `fontspec` for feature definition (*i.e.*, using `xkeyval`) but with a conditional to restrict the scope of these features to unicode-math commands.

```
800 \newcommand\um@zf@feature[2]{
801   \define@key[zf]{options}{#1}[]{
802     \bool_if:NTF \l_um_fontspec_feature_bool {
803       #2
804     }{
805       \um_warning:n {maths-feature-only}
806     }
807   }
808 }
```

8.1 OpenType maths font features

```
809 \um@zf@feature{ScriptStyle}{
810   \zf@update@ff{+ssty=0}
811 }
812 \um@zf@feature{ScriptScriptStyle}{
813   \zf@update@ff{+ssty=1}
814 }
```

8.2 Script and scriptscript font options

```
815 \keys_define:nn {unicode-math}
816 {
817   script-features .tl_set:N = \l_um_script_features_tl ,
818   sscript-features .tl_set:N = \l_um_sscript_features_tl ,
819   script-font .tl_set:N = \l_um_script_font_tl ,
820   sscript-font .tl_set:N = \l_um_sscript_font_tl ,
821 }
```

8.3 Range processing

```
822 \seq_new:N \l_um_mathalph_seq
823 \seq_new:N \l_um_char_range_seq
824 \keys_define:nn {unicode-math} {
825   range .code:n = {

860   \tl_set:Nn \l_um_tmpc_tl {#2}
861 }

862 \cs_set:Npn \um_split_slash:w #1/#2 \q_nil {
863   \tl_set:Nn \l_um_tmpa_tl {#1}
864   \tl_set:Nn \l_um_tmpb_tl {#2}
865 }

```

Pretty basic comma separated range processing. Donald Arseneau's selectp package has a cleverer technique.

\um@parse@term

- #1 : unicode character slot
- #2 : control sequence (character macro)
- #3 : control sequence (math type)
- #4 : code to execute

This macro expands to #4 if any of its arguments are contained in \l_um_char_range_seq. This list can contain either character ranges (for checking with #1) or control sequences. These latter can either be the command name of a specific character, *or* the math type of one (*e.g.*, \mathbin).

Character ranges are passed to \um@parse@range, which accepts input in the form shown in table 15.

Table 15: Ranges accepted by `\um@parse@range`.

Input	Range
x	$r = x$
x-	$r \geq x$
-y	$r \leq y$
x-y	$x \leq r \leq y$

Start by iterating over the commalist, ignoring empties, and initialising the scratch conditional:

```

866 \newcommand\um@parse@term[4]{
867   \seq_map_variable:NNn \l_um_char_range_seq \@ii {
868     \unless\ifx\@ii\@empty
869       \@tempswafalse

```

Match to either the character macro (`\alpha`) or the math type (`\mathbin`):

```

870     \expandafter\um@firstchar\expandafter{\@ii}
871     \ifx\@tempa\um@backslash
872       \expandafter\ifx\@ii#2\relax
873         \@tempswatrue
874       \else
875         \expandafter\ifx\@ii#3\relax
876           \@tempswatrue
877         \fi
878       \fi

```

Otherwise, we have a number range, which is passed to another macro:

```

879     \else
880       \expandafter\um@parse@range\@ii-\@marker-\@nil#1\@nil
881     \fi

```

If we have a match, execute the code! It also populates the `\l_um_char_num_range_clist` macro, which is used when defining `\mathbf` (*etc.*) `\mathchar` remappings.

```

882     \if@tempswa
883       \clist_put_right:Nx \l_um_char_num_range_clist { \int-
884         expr_eval:n {#1} }
885       #4
886     \fi
887   \fi
888 }
889 \def\um@firstof#1#2\@nil{#1}
890 \edef\um@backslash{\expandafter\um@firstof\string\string\@nil}
891 \def\um@firstchar#1{\edef\@tempa{\expandafter\um@firstof\string#1\@nil}}

```

`\um@parse@range` Weird syntax. As shown previously in table 15, this macro can be passed four different input types via `\um@parse@term`.

```

892 \def\um@parse@range#1-#2-#3\@nil#4\@nil{
893   \def\@tempa{#1}
894   \def\@tempb{#2}

```

8.4 Resolving Greek symbol name control sequences

`\um_resolve_greek:` This macro defines `\Alpha...` `\omega` as their corresponding unicode (mathematical italic) character. Remember that the mapping to upright or italic happens with the mathcode definitions, whereas these macros just stand for the literal unicode characters.

```

1029 \AtBeginDocument{\um_resolve_greek:}

```

```

1030 \cs_new:Npn \um_resolve_greek: {

1052   }
1053 }

```

9 Maths alphabets mapping definitions

Algorithm for setting alphabet fonts. By default, when `range` is empty, we are in *implicit* mode. If `range` contains the name of the math alphabet, we are in *explicit* mode and do things slightly differently.

Implicit mode:

- Try and set all of the alphabet shapes.
- Check for the first glyph of each alphabet to detect if the font supports each alphabet shape.
- For alphabets that do exist, overwrite whatever's already there.
- For alphabets that are not supported, *do nothing*. (This includes leaving the old alphabet definition in place.)

Explicit mode:

- Only set the alphabets specified.
- Check for the first glyph of the alphabet to detect if the font contains the alphabet shape in the unicode math plane.

- For unicode math alphabets, overwrite whatever's already there.
- Otherwise, use the ASCII letters instead.

9.0.1 Macros

`\um_prepare_alph:n,\um_prepare_alph:f` Define the high level math alphabet macros (`\mathit`, etc.) in terms of unicode-math definitions. Use `\bgroup/\egroup` so s'scripts scan the whole thing.

```

1054 \cs_new:Npn \um_prepare_alph:n #1 {
1055   \um_init_alphabet:x {\use_none:nnnn #1}
1056   \cs_set:cpn {um_#1:n} ##1 {
1057     \use:c {um_switchto_#1:} ##1 \egroup
1058   }
1059   \cs_set_protected:cpx {#1} {
1060     \exp_not:n{
1061       \bgroup
1062       \mode_if_math:F {
1063         \egroup\expandafter
1064         \non@alpherr\expandafter{\csname #1\endcsname\space}
1065       }
1066     }
1067     \exp_not:c {um_#1:n}
1068   }
1069 }
1070 \cs_generate_variant:Nn \um_prepare_alph:n {f}

```

This is every math alphabet known to unicode-math:

`\g_um_mathalph_seq`

```

10 Definitions of the math symbols

Here we define every unicode math codepoint an equivalent macro name. The two are equivalent, in a `\let\xyz=^^^1234` kind of way.

`\um@scancharlet` We need to do some trickery to transform the `\UnicodeMathSymbol` argument `\um@scanactivedef` "ABCDEF into the \TeX ‘caret input’ form `^^^^abcdef`. It is *very important* that the argument has five characters. Otherwise we need to change the number of ^ chars.

To do this, turn ^ into a regular ‘other’ character and define the macro to perform the lowercasing and `\let`. `\scantokens` changes the carets back into their original meaning after the group has ended and ^’s catcode returns to normal.

```

1812 \begingroup
1813   \char_make_other:N \^
1814   \cs_gset:Npn \um@scancharlet#1="#2\@nil {
1815     \lowercase{
1816       \tl_rescan:nn {

```

```

1817         \char_make_other:N \{
1818         \char_make_other:N \}
1819         \char_make_other:N \&
1820         \char_make_other:N \%
1821         \char_make_other:N \$
1822     }{
1823     \global\let#1=^^^^^#2
1824 }
1825 }
1826 }

```

Making ^ the right catcode isn't strictly necessary right now but it helps to future proof us with, e.g., breqn.

```

1827 \gdef\um@scanactivedef"#1\@nil#2{
1828     \lowercase{
1829         \tl_rescan:nn{
1830             \ExplSyntaxOn
1831             \char_make_math_superscript:N\^
1832         }{
1833             \global\def^^^^^#1{#2}
1834         }
1835     }
1836 }
1837 \endgroup

```

Now give \UnicodeMathSymbol a definition in terms of \um@scancharlet and we're good to go. Make sure # is an 'other' so that we don't get confused with \mathoctothorpe.

```

1838 \AtBeginDocument{
1839     \group_begin:
1840         \char_make_math_superscript:N\^
1841         \def\UnicodeMathSymbol#1#2#3#4{
1842             \bool_if:nF { \cs_if_eq_p:NN #3 \mathaccent ||
1843                 \cs_if_eq_p:NN #3 \mathopen ||
1844                 \cs_if_eq_p:NN #3 \mathclose } {
1845                 \um@scancharlet#2=#1\@nil\ignorespaces
1846             }
1847         }
1848         \char_make_other:N \#
1849         \@input{unicode-math-table.tex}
1850     \group_end:
1851 }

```

Fix \backslash, which is defined as the escape char character above:

```

1852 \group_begin:
1853     \lccode`\*=`\
1854     \char_make_escape:N \

```

```

1855 \char_make_other:N \\\
1856 |lowercase{
1857   |AtBeginDocument{
1858     |let|backslash=*
1859   }
1860 }
1861 |group_end:
Fix \backslash:

```

11 Epilogue

Lots of little things to tidy up.

11.0.15 Primes

We need a new ‘prime’ algorithm. Unicode math has four pre-drawn prime glyphs.

```

u+2032 prime (\prime):  $x'$ 
u+2033 double prime (\dprime):  $x''$ 
u+2034 triple prime (\trprime):  $x'''$ 
u+2057 quadruple prime (\qprime):  $x''''$ 

```

As you can see, they’re all drawn at the correct height without being superscripted. However, in a correctly behaving OpenType font, we also see different behaviour after the `ssty` feature is applied:

$x' \ x'' \ x''' \ x''''$

The glyphs are now ‘full size’ so that when placed inside a superscript, their shape will match the originally sized ones. Many thanks to Ross Mills of Tiro Typeworks for originally pointing out this behaviour.

In regular \LaTeX , primes can be entered with the straight quote character `'`, and multiple straight quotes chain together to produce multiple primes. Better results can be achieved in unicode-math by chaining multiple single primes into a pre-drawn multi-prime glyph; consider x''' vs. x''' .

For unicode maths, we wish to conserve this behaviour and augment it with the possibility of adding any combination of unicode prime or any of the n -prime characters. E.g., the user might copy-paste a double prime from another source and then later type another single prime after it; the output should be the triple prime.

Our algorithm is:

- Prime encountered; pcount=1.

- Scan ahead; if prime: pcount:=pcount+1; repeat.
- If not prime, stop scanning.
- If pcount=1, \prime, end.
- If pcount=2, check \dprime; if it exists, use it, end; if not, goto last step.
- Ditto pcount=3 & \trprime.
- Ditto pcount=4 & \qprime.
- If pcount>4 or the glyph doesn't exist, insert pcount \primes with \primekern between each.

11.0.16 Unicode radicals

`\r@@t` #1 : A mathstyle (for `\mathpalette`)
 #2 : Leading superscript for the sqrt sign
 A re-implementation of L^AT_EX's hard-coded n-root sign using the appropriate `\fontdimens`.

```

2041 \cs_set_nopar:Npn \r@@t #1#2 {
2042   \setbox\z@\hbox{$\m@th #1\sqrtsign{#2}$}
2043   \um_mathstyle_scale:Nnn{#1}{\kern}{\fontdimen63\l_um_font}
2044   \raise \dimexpr(
2045     \um_fontdimen_to_percent:nn{65}{\l_um_font}\ht\z@-
2046     \um_fontdimen_to_percent:nn{65}{\l_um_font}\dp\z@
2047   )\relax
2048   \copy \rootbox
2049   \um_mathstyle_scale:Nnn{#1}{\kern}{\fontdimen64\l_um_font}
2050   \box \z@
2051 }

```

`\um_fontdimen_to_percent:nn` #1 : Font dimen number
 #2 : Font 'variable'
`\fontdimens` 10, 11, and 65 aren't actually dimensions, they're percentage values given in units of sp. This macro takes a font dimension number and outputs the decimal value of the associated parameter.

```

2052 \cs_new:Npn \um_fontdimen_to_percent:nn #1#2 {
2053   0.\strip@pt\dimexpr\fontdimen#1#2 *65536\relax
2054 }

```

`\um_mathstyle_scale:Nnn` #1 : A math style (`\scriptstyle`, say)
 #2 : Macro that takes a non-delimited length argument (like `\kern`)
 #3 : Length control sequence to be scaled according to the math style
 This macro is used to scale the lengths reported by `\fontdimen` according to the scale factor for script- and scriptscript-size objects.

```

2055 \cs_new:Npn \um_mathstyle_scale:Nnn #1#2#3 {
2056   \ifx#1\scriptstyle
2057     #2\um_fontdimen_to_percent:nn{10}\l_um_font#3
2058   \else
2059     \ifx#1\scriptscriptstyle
2060       #2\um_fontdimen_to_percent:nn{11}\l_um_font#3
2061     \else

```

```

2062     #2#3
2063     \fi
2064 \fi
2065 }

```

11.0.17 Unicode sub- and super-scripts

The idea here is to enter a scanning state after a superscript or subscript is encountered. If subsequent superscripts or subscripts (resp.) are found, they are lumped together. Each sub/super has a corresponding regular size glyph which is used by $\text{Xe}\text{L}\text{a}\text{T}\text{E}\text{X}$ to typeset the results; this means that the actual subscript/superscript glyphs are never seen in the output document — they are only used as input characters.

Open question: should the superscript-like ‘modifiers’ (U+1D2C modifier capital letter A and on) be included here?

First, the setup of each mathactive char:

```

2066 \prop_new:N \g_um_supers_prop
2067 \prop_new:N \g_um_subs_prop
2068
2069 \group_begin:
2070
2071 % Populate a property list with superscript characters; their mean-
2072 % ing as their key,
2073 % for reasons that will become apparent soon, and their replace-
2074 % ment as each key's value.
2075 % Then make the superscript active and bind it to the scanning function.
2076 %
2077 % \cs{scantokens} makes this process much simpler since we can acti-
2078 % vate the char
2079 % and assign its meaning in one step.
2080 \cs_set:Npn \um_setup_active_superscript:nn #1#2 {

2244 \um_setup_active_frac:

```

11.0.19 Synonyms and all the rest

We need to change L^AT_EX's idea of the font used to typeset things like `\sin` and `\cos`:

```

2245 \def\operator@font{\um_switchto_mathup:}
2246 \def\to{\rightarrow}
2247 \def\overrightarrow{\vec}
2248 \def\le{\leq}
2249 \def\ge{\geq}
2250 \def\neq{\ne}
2251 \def\triangle{\mathord{\bigtriangleup}}
2252 \def\bigcirc{\mdlgwhtcircle}
2253 \def\circ{\vysmwhtcircle}
2254 \def\bullet{\smblkcircle}
2255 \def\mathyen{\yen}
2256 \def\mathsterling{\sterling}

```

`\colon` Define `\colon` as a mathpunct `‘:’`. This is wrong: it should be `u+003A` colon instead! We hope no-one will notice.

```

2257 \@ifpackageloaded{amsmath}{
2258   % define their own colon, perhaps I should just steal it. (It does look much bet-
2259   % ter.)
2259 }{
2260   \cs_set_protected:Npn \colon {

```

```

2261 \bool_if:NTF \g_um_literal_colon_bool {::} { \mathpunct{:} }
2262 }
2263 }

\mathcal
2264 \def\mathcal{\mathscr}

\mathrm
2265 \def\mathrm{\mathup}
2266 \let\mathfence\mathord

\digamma I might end up just changing these in the table.
\Digamma 2267 \def\digamma{\updigamma}
2268 \def\Digamma{\upDigamma}

```

11.0.20 Compatibility

```

\um_patch_pkg:nn #1 : package
#2 : code
If <package> is loaded either already or later in the preamble, <code> is executed
(after the package is loaded in the latter case).
2269 \cs_new:Npn \um_patch_pkg:nn #1#2 {
2270 \@ifpackageloaded {#1} {
2271 #2
2272 }{
2273 \um_after_pkg:nn {#1} {#2}
2274 }
2275 }

```

url Simply need to get url in a state such that when it switches to math mode and enters ASCII characters, the maths setup (i.e., unicode-math) doesn't remap the symbols into Plane 1. Which is, of course, what `\mathup` is doing.

This is the same as writing, e.g., `\def\UrlFont{\ttfamily\um_switchto_mathup:}` but activates automatically so old documents that might change the `\url` font still work correctly.

```

2276 \um_patch_pkg:nn {url} {
2277 \tl_put_left:Nn \Url@FormatString { \um_switchto_mathup: }
2278 \tl_put_right:Nn \UrlSpecials {
2279 \do\{\mathchar`\ }
2280 \do\'\mathchar`\ '
2281 \do\$\mathchar`\ $
2282 \do\&\mathchar`\ &
2283 }
2284 }

```

amsmath Since the mathcode of `\-` is greater than eight bits, this piece of `\AtBeginDocument` code from `amsmath` dies if we try and set the maths font in the preamble:

```
2285 \um_patch_pkg:n {amsmath} {
2286   \tl_remove_in:Nn \@begindocumenthook {
2287     \mathchardef\std@minus\mathcode`\-\relax
2288     \mathchardef\std@equal\mathcode`\=\relax
2289   }
2290   \def\std@minus{\Umathcharnum\Umathcodenum`\-\relax}
2291   \def\std@equal{\Umathcharnum\Umathcodenum`\=\relax}
2292   \def\@cdots{\mathinner{\cdots}}
2293   \cs_set_eq:NN \dotso@ \cdots
2294 }
```

amsopn This code is to improve the output of alphabetic symbols in text of operator names (`\sin`, `\cos`, etc.). Just comment out the offending lines for now:

```
2295 \um_patch_pkg:n {amsopn} {
2296   \cs_set:Npn \newmcodes@ {
2297     \mathcode`\'39\scan_stop:
2298     \mathcode`\*42\scan_stop:
2299     \mathcode`\."613A\scan_stop:
2300     %% \ifnum\mathcode`\-45 \else
2301     %%   \mathchardef\std@minus\mathcode`\-\relax
2302     %% \fi
2303     \mathcode`\-45\scan_stop:
2304     \mathcode`\ /47\scan_stop:
2305     \mathcode`\:"603A\scan_stop:
2306   }
2307 }
```

Symbols

```
2308 \cs_set:Npn \l {\Vert}
2309 \mathinner items:
2309 \cs_set:Npn \mathellipsis {\mathinner{\unicodeellipsis}}
2310 \cs_set:Npn \cdots {\mathinner{\unicodcdots}}
```

Accents

```
2311 \AtBeginDocument{
2312   \def\widehat{\hat}
2313   \def\widetilde{\tilde}
2314 }
```

beamer At end of the package so the warnings are defined.

```

2315 \AtEndOfPackage{
2316   \@ifclassloaded{beamer}{
2317     \ifbeamer@suppressreplacements\else
2318       \um_warning:n {disable-beamer}
2319       \beamer@suppressreplacementstrue
2320     \fi
2321   }{}

13 STIX table data extraction

The source for the \TeX names for the very large number of mathematical glyphs are provided via Barbara Beeton’s table file for the STIX project ([ams.org/STIX](http://www.ams.org/STIX)). A version is located at <http://www.ams.org/STIX/bnb/stix-tbl.asc> but check <http://www.ams.org/STIX/> for more up-to-date info.

This table is converted into a form suitable for reading by \XeTeX . A single file is produced containing all (more than 3298) symbols. Future optimisations might include generating various (possibly overlapping) subsets so not all definitions must be read just to redefine a small range of symbols. Performance for now seems to be acceptable without such measures.

This file is currently developed outside this DTX file. It will be incorporated when the final version is ready. (I know this is not how things are supposed to work!)

2362 < See stix-extract.sh for now. >

A Documenting maths support in the NFSS

In the following, $\langle NFSS\ decl. \rangle$ stands for something like $\{\mathrm{T1}\}\{\mathrm{lmr}\}\{\mathrm{m}\}\{\mathrm{n}\}$.

Maths symbol fonts Fonts for symbols: α , \leq , \rightarrow

$\backslash\mathrm{DeclareSymbolFont}\{\langle name \rangle\}\langle NFSS\ decl. \rangle$

Declares a named maths font such as operators from which symbols are defined with $\backslash\mathrm{DeclareMathSymbol}$.

Maths alphabet fonts Fonts for $ABC-xyz$, $\mathfrak{ABC}-\mathcal{XYZ}$, etc.

$\backslash\mathrm{DeclareMathAlphabet}\{\langle cmd \rangle\}\langle NFSS\ decl. \rangle$

For commands such as $\backslash\mathrm{mathbf}$, accessed through maths mode that are unaffected by the current text font, and which are used for alphabetic symbols in the ASCII range.

$\backslash\mathrm{DeclareSymbolFontAlphabet}\{\langle cmd \rangle\}\{\langle name \rangle\}$

Alternative (and optimisation) for `\DeclareMathAlphabet` if a single font is being used for both alphabetic characters (as above) and symbols.

Maths ‘versions’ Different maths weights can be defined with the following, switched in text with the `\mathversion{<maths version>}` command.

```
\SetSymbolFont{<name>}{<maths version>}{NFSS decl.}
\SetMathAlphabet{<cmd>}{<maths version>}{NFSS decl.}
```

Maths symbols Symbol definitions in maths for both characters (=) and macros (`\eqdef`): `\DeclareMathSymbol{<symbol>}{<type>}{<named font>}{<slot>}` This is the macro that actually defines which font each symbol comes from and how they behave.

Delimiters and radicals use wrappers around \TeX ’s `\delimiter`/`\radical` primitives, which are re-designed in $\X_{\mathbb{E}}\TeX$. The syntax used in \LaTeX ’s NFSS is therefore not so relevant here.

Delimiters A special class of maths symbol which enlarge themselves in certain contexts.

```
\DeclareMathDelimiter{<symbol>}{<type>}{<sym. font>}{<slot>}{<sym. font>}{<slot>}
```

Radicals Similar to delimiters (`\DeclareMathRadical` takes the same syntax) but behave ‘weirdly’. `\sqrt` might very well be the only one.

In those cases, glyph slots in *two* symbol fonts are required; one for the small (‘regular’) case, the other for situations when the glyph is larger. This is not the case in $\X_{\mathbb{E}}\TeX$.

Accents are not included yet.

Summary For symbols, something like:

```
\def\DeclareMathSymbol#1#2#3#4{
  \global\mathchardef#1"\mathchar@type#2
  \expandafter\hexnumber@\csname sym#2\endcsname
  {\hexnumber@{\count\z@}\hexnumber@{\count\tw@}}}
```

For characters, something like:

```
\def\DeclareMathSymbol#1#2#3#4{
  \global\mathcode`#1"\mathchar@type#2
  \expandafter\hexnumber@\csname sym#2\endcsname
  {\hexnumber@{\count\z@}\hexnumber@{\count\tw@}}}
```

B X_YTeX math font dimensions

These are the extended `\fontdimens` available for suitable fonts in X_YTeX. Note that LuaTeX takes an alternative route, and this package will eventually provide a wrapper interface to the two (I hope).

<code>\fontdimen</code>	Dimension name	Description
10	<code>SCRIPTPERCENTSCALEDOWN</code>	Percentage of scaling down for script level 1. Suggested value: 80%.
11	<code>SCRIPTSCRIPTPERCENTSCALEDOWN</code>	Percentage of scaling down for script level 2 (ScriptScript). Suggested value: 60%.
12	<code>DELIMITEDSUBFORMULAMINHEIGHT</code>	Minimum height required for a delimited expression to be treated as a subformula. Suggested value: normal line height \times 1.5.
13	<code>DISPLAYOPERATORMINHEIGHT</code>	Minimum height of n-ary operators (such as integral and summation) for formulas in display mode.
14	<code>MATHLEADING</code>	White space to be left between math formulas to ensure proper line spacing. For example, for applications that treat line gap as a part of line ascender, formulas with ink going above (<code>os2.sTypoAscender</code> + <code>os2.sTypoLineGap</code> – <code>MathLeading</code>) or with ink going below <code>os2.sTypoDescender</code> will result in increasing line height.
15	<code>AXISHEIGHT</code>	Axis height of the font.
16	<code>ACCENTBASEHEIGHT</code>	Maximum (ink) height of accent base that does not require raising the accents. Suggested: x-height of the font (<code>os2.sxHeight</code>) plus any possible overshots.
17	<code>FLATTENEDACCENTBASEHEIGHT</code>	Maximum (ink) height of accent base that does not require flattening the accents. Suggested: cap height of the font (<code>os2.sCapHeight</code>).
18	<code>SUBSCRIPTSHIFTDOWN</code>	The standard shift down applied to subscript elements. Positive for moving in the downward direction. Suggested: <code>os2.ySubscriptYOffset</code> .

\fontdimen	Dimension name	Description
19	SUBSCRIPTTOPMAX	Maximum allowed height of the (ink) top of subscripts that does not require moving subscripts further down. Suggested: $\frac{1}{5}$ x-height.
20	SUBSCRIPTBASELINEDROPMIN	Minimum allowed drop of the baseline of subscripts relative to the (ink) bottom of the base. Checked for bases that are treated as a box or extended shape. Positive for subscript baseline dropped below the base bottom.
21	SUPERSCRIPSHIFTUP	Standard shift up applied to superscript elements. Suggested: $os2.ySuperscriptYOffset$.
22	SUPERSCRIPSHIFTUPCRAMPED	Standard shift of superscripts relative to the base, in cramped style.
23	SUPERSCRIPBOTTOMMIN	Minimum allowed height of the (ink) bottom of superscripts that does not require moving subscripts further up. Suggested: $\frac{1}{4}$ x-height.
24	SUPERSCRIPBASELINEDROP-MAX	Maximum allowed drop of the baseline of superscripts relative to the (ink) top of the base. Checked for bases that are treated as a box or extended shape. Positive for superscript baseline below the base top.
25	SUBSUPERSCRIPGAPMIN	Minimum gap between the superscript and subscript ink. Suggested: $4 \times$ default rule thickness.
26	SUPERSCRIPBOTTOMMAX-WITHSUBSCRIPT	The maximum level to which the (ink) bottom of superscript can be pushed to increase the gap between superscript and subscript, before subscript starts being moved down. Suggested: $\frac{1}{5}$ x-height.
27	SPACEAFTERSCRIP	Extra white space to be added after each subscript and superscript. Suggested: 0.5pt for a 12 pt font.
28	UPPERLIMITGAPMIN	Minimum gap between the (ink) bottom of the upper limit, and the (ink) top of the base operator.
29	UPPERLIMITBASELINERISEMIN	Minimum distance between baseline of upper limit and (ink) top of the base operator.

\fontdimen	Dimension name	Description
30	LOWERLIMITGAPMIN	Minimum gap between (ink) top of the lower limit, and (ink) bottom of the base operator.
31	LOWERLIMITBASELINEDROP-MIN	Minimum distance between baseline of the lower limit and (ink) bottom of the base operator.
32	STACKTOPSHIFTUP	Standard shift up applied to the top element of a stack.
33	STACKTOPDISPLAYSTYLESHIFTUP	Standard shift up applied to the top element of a stack in display style.
34	STACKBOTTOMSHIFTDOWN	Standard shift down applied to the bottom element of a stack. Positive for moving in the downward direction.
35	STACKBOTTOMDISPLAYSTYLE-SHIFTDOWN	Standard shift down applied to the bottom element of a stack in display style. Positive for moving in the downward direction.
36	STACKGAPMIN	Minimum gap between (ink) bottom of the top element of a stack, and the (ink) top of the bottom element. Suggested: 3×default rule thickness.
37	STACKDISPLAYSTYLEGAPMIN	Minimum gap between (ink) bottom of the top element of a stack, and the (ink) top of the bottom element in display style. Suggested: 7×default rule thickness.
38	STRETCHSTACKTOPSHIFTUP	Standard shift up applied to the top element of the stretch stack.
39	STRETCHSTACKBOTTOMSHIFT-DOWN	Standard shift down applied to the bottom element of the stretch stack. Positive for moving in the downward direction.
40	STRETCHSTACKGAPABOVEMIN	Minimum gap between the ink of the stretched element, and the (ink) bottom of the element above. Suggested: UpperLimitGapMin
41	STRETCHSTACKGAPBELOWMIN	Minimum gap between the ink of the stretched element, and the (ink) top of the element below. Suggested: LowerLimitGapMin.
42	FRACTIONNUMERATORSHIFTUP	Standard shift up applied to the numerator.

\fontdimen	Dimension name	Description
43	FRACTIONNUMERATOR- DISPLAYSTYLESHIFTUP	Standard shift up applied to the numerator in display style. Suggested: StackTopDisplayStyleShiftUp.
44	FRACTIONDENOMINATORSHIFT- DOWN	Standard shift down applied to the denominator. Positive for moving in the downward direction.
45	FRACTIONDENOMINATOR- DISPLAYSTYLESHIFTDOWN	Standard shift down applied to the denominator in display style. Positive for moving in the downward direction. Suggested: StackBottomDisplayStyleShiftDown.
46	FRACTIONNUMERATORGAP- MIN	Minimum tolerated gap between the (ink) bottom of the numerator and the ink of the fraction bar. Suggested: default rule thickness
47	FRACTIONNUMDISPLAYSTYLE- GAPMIN	Minimum tolerated gap between the (ink) bottom of the numerator and the ink of the fraction bar in display style. Suggested: 3×default rule thickness.
48	FRACTIONRULETHICKNESS	Thickness of the fraction bar. Suggested: default rule thickness.
49	FRACTIONDENOMINATORGAP- MIN	Minimum tolerated gap between the (ink) top of the denominator and the ink of the fraction bar. Suggested: default rule thickness
50	FRACTIONDENOMDISPLAY- STYLEGAPMIN	Minimum tolerated gap between the (ink) top of the denominator and the ink of the fraction bar in display style. Suggested: 3×default rule thickness.
51	SKewedFRACTION- HORIZONTALGAP	Horizontal distance between the top and bottom elements of a skewed fraction.
52	SKewedFRACTIONVERTICAL- GAP	Vertical distance between the ink of the top and bottom elements of a skewed fraction.
53	OVERBARVERTICALGAP	Distance between the overbar and the (ink) top of the base. Suggested: 3×default rule thickness.
54	OVERBARRULETHICKNESS	Thickness of overbar. Suggested: default rule thickness.

\fontdimen	Dimension name	Description
55	OVERBAREXTRAASCENDER	Extra white space reserved above the overbar. Suggested: default rule thickness.
56	UNDERBARVERTICALGAP	Distance between underbar and (ink) bottom of the base. Suggested: 3×default rule thickness.
57	UNDERBARRULETHICKNESS	Thickness of underbar. Suggested: default rule thickness.
58	UNDERBAREXTRADESCENDER	Extra white space reserved below the underbar. Always positive. Suggested: default rule thickness.
59	RADICALVERTICALGAP	Space between the (ink) top of the expression and the bar over it. Suggested: 1¼ default rule thickness.
60	RADICALDISPLAYSTYLE- VERTICALGAP	Space between the (ink) top of the expression and the bar over it. Suggested: default rule thickness + ¼ x-height.
61	RADICALRULETHICKNESS	Thickness of the radical rule. This is the thickness of the rule in designed or constructed radical signs. Suggested: default rule thickness.
62	RADICALEXTRAASCENDER	Extra white space reserved above the radical. Suggested: RadicalRuleThickness.
63	RADICALKERNBEFOREDEGREE	Extra horizontal kern before the degree of a radical, if such is present. Suggested: 5/18 of em.
64	RADICALKERNAFTERDEGREE	Negative kern after the degree of a radical, if such is present. Suggested: −10/18 of em.
65	RADICALDEGREEBOTTOM- RAISEPERCENT	Height of the bottom of the radical degree, if such is present, in proportion to the ascender of the radical sign. Suggested: 60%.

Index

Numbers written in *italic* refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in *roman* refer to the code lines where the entry is used.
