# Experimental unicode mathematical typesetting: The unicode-math package

# Will Robertson

2009/09/29 v0.4

#### Abstract

Warning! This package is experimental and subject to change without regard for backwards compatibility. Performance issues may be encountered until algorithms are refined.

# 1 Introduction

This document describes the unicode-math package, which is an *experimental* implementation of a macro to unicode glyph encoding for mathematical characters. Its intended use is for X<sub>1</sub>T<sub>E</sub>X, although it is conjectured that some effect could be spent to create a cross-format package that would also work with LuaT<sub>E</sub>X.

Users who desire to specify maths alphabets only from various fonts may wish to use Andrew Moschou's mathspec package instead.

# 2 Unicode maths font setup

In the ideal case, a single unicode font will contain all maths glyphs we need. The file unicode-math-table.tex (based on Barbara Beeton's STIX table) provides the mapping between unicode maths glyphs and macro names (all 3298 — or however many — of them!). A single command

\setmathfont[\(\)(font features\)]{\(\)(font name\)}

implements this for every every symbol and alphabetic variant. That means x to x, x to  $\xi$ , leq to leq, etc.,  $\mathcal{H}$  and so on, all for unicode glyphs within a single font.

This package deals well with unicode characters for maths input. This includes using literal Greek letters in formulae, resolving to upright or italic depending on preference.

Finally, maths versions must also be provided for. While I guess version selection in LATEX will remain the same, the specification for choosing the version fonts will probably be an optional argument:

\setmathfont[Version=Bold, \( \font \textit{features} \) \[ \( \font \textit{name} \) \]

This has not been implemented yet.

Instances above of

[\(\)font features\\]{\(\)font name\\\}

follow from my fontspec package, and therefore any additional (*font features*) specific to maths fonts will hook into fontspec's methods.

# 2.1 Using multiple fonts

There will probably be few cases where a single unicode maths font suffices (simply due to glyph coverage). The upcoming STIX font comes to mind as a possible exception. It will therefore be necessary to delegate specific unicode ranges of glyphs to separate fonts:

\setmathfont[Range=\(unicode range\),\(font features\)]\{\(font name\)\} where \(unicode range\) is a comma-separated list of unicode slots and ranges such as \{27D0-27EB,27FF,295B-297F\}. You may also use the macro for accessing the glyph, such as \\\, or whole collection of symbols with the same math type, such as \\\mathref{mathr

Not yet implemented: preset names ranges could be used in the range spec., such as MiscMathSymbolsA, with such ranges based on unicode chunks. The amount of optimisation required here to achieve acceptable performance has yet to be determined. Techniques such as saving out unicode subsets based on (unicode range) data to be \input in the next LATEX run are a possibility, but at this stage, performance without such measures seems acceptable.

# 2.2 Script and scriptscript fonts/features

Cambria Math uses OpenType font features to activate smaller optical sizes for scriptsize and scriptscriptsize symbols (the B and C, respectively, in  $A_{B_c}$ ). Other fonts will possibly use entirely separate fonts.

Not yet implemented: Both of these options must be taken into account. I hope this will be mostly automatic from the users' points of view. The +ssty feature can be detected and applied automatically, and appropriate optical size information embedded in the fonts will ensure this latter case. Fine tuning should be possible automatically with fontspec options. We might have to wait until MnMath, for example, before we really know.

# 3 Maths input

X<sub>T</sub>T<sub>E</sub>X's unicode support allows maths input through two methods. Like classical T<sub>E</sub>X, macros such as \alpha, \sum, \pm, \leq, and so on, provide verbose access to the entire repertoire of characters defined by unicode. The literal characters themselves may be used instead, for more readable input files.

#### 3.1 Math 'style'

Classically, TEX uses italic lowercase Greek letters and *upright* uppercase Greek letters for variables in mathematics. This is contrary to the ISO standards of using italic forms for both upper- and lowercase. Furthermore, the French (contrary

Table 1: Effects of the math-style package option.

	Exan	nple
Package option	Latin	Greek
math-style=ISO math-style=TeX	(a, z, B, X) (a, z, B, X)	$(\alpha, \beta, \Gamma, \Xi)$ $(\alpha, \beta, \Gamma, \Xi)$
math-style=French	(a, z, B, X)	$(\alpha, \beta, \Gamma, \Xi)$

again, *quelle surprise*) have been known to use upright uppercase *Latin* letters as well as upright upper- and lowercase Greek.

The unicode-math package accommodates these possibilities with an interface heavily inspired by Walter Schmidt's lucimatx package: a package option math-style that takes one of three arguments: TeX, ISO, or French (case *insensitive*).

The philosophy behind the interface to the mathematical alphabet symbols lies in LaTeX's attempt of separating content and formatting. Because input source text may come from a variety of places, the upright and 'mathematical' italic Latin and Greek alphabets are *unified* from the point of view of having a specified meaning in the source text. That is, to get a mathematical 'x', either the ascii ('keyboard') letter x may be typed, or the actual unicode character may be used. Similarly for Greek letters. The upright or italic forms are then chosen based on the math-style package option.

If glyphs are desired that do not map as per the package option (for example, an upright 'g' is desired but typing g yields 'g'), markup is required to specify this; to follow from the example:  $\mathbb{g}$ . Maths alphabets commands such as  $\mathbf{g}$ 

**Alternative interface** However, some users may not like this convention. For them, an upright x is an upright 'x' and that's that. (This will be the case when obtaining source text from copy/pasting PDF or Microsoft Word documents, for example.) For these users, the literal option to math-style will effect this behaviour.

The math-style options' effects are shown in brief in table 1.

# 3.2 Bold style

Similar as in the previous section, ISO standards differ somewhat to TEX's conventions (and classical typesetting) for 'boldness' in mathematics. In the past, it has been customary to use bold *upright* letters to denote things like vectors and matrices. For example,  $\mathbf{M} = (M_x, M_y, M_z)$ . Presumably, this was due to the relatively

Table 2: Effects of the bold-style package option.

	Exan	nple
Package option	Latin	Greek
bold-style=ISO	(a, z, B, X)	$(\alpha, \beta, \Gamma, \Xi)$
bold-style=TeX	$(\mathbf{a}, \mathbf{z}, \mathbf{B}, \mathbf{X})$	$(\boldsymbol{\alpha}, \boldsymbol{\beta}, \boldsymbol{\Gamma}, \boldsymbol{\Xi})$
bold-style=French	(a, z, B, X)	$(\alpha, \beta, \Gamma, \Xi)$

scarcity of bold italic fonts in the pre-digital typesetting era. It has been suggested that *italic* bold symbols are used nowadays instead.

Bold Greek letters have simply been bold variant glyphs of their regular weight, as in  $\boldsymbol{\xi}=(\xi_r,\xi_\varphi,\xi_\theta)$ . Confusingly, the syntax in LATEX has been different for these two examples: \mathbf in the former ('**M**'), and \bm (or \boldsymbol, deprecated) in the latter (' $\boldsymbol{\xi}$ ').

In unicode-math, the \mathbf command works directly with both Greek and Latin maths alphabet characters and depending on package option either switches to upright for Latin letters (bold-style=TeX) as well or keeps them italic (bold-style=ISO).

To match the package options for non-bold characters, for bold-style=French all bold characters are upright, and bold-style=literal does not change the upright/italic shape of the letter.

Upright and italic bold mathematical letters input as direct unicode characters are normalised with the same rules. For example, with bold-style=TeX, a literal bold italic latin character will be typeset upright.

Note that bold-style is independent of math-style, although if the former is not specified then sensible defaults are chosen based on the latter.

The bold-style options' effects are shown in brief in table 2.

# 3.3 Sans serif style

Unicode contains upright and italic, medium and bold mathematical alphabet characters. These may be explicitly selected with the \mathsfup, \mathsfit, \mathbfsfup, and \mathbfsfit commands discussed in section §3.4.

How should the generic \mathsf behave? Unlike bold, sans serif is used much more sparingly in mathematics. I've seen recommendations to typeset tensors in sans serif italic or sans serif italic bold (e.g., examples in the isomath and mattens packages). But LaTeX's \mathsf is upright sans serif.

Therefore I reluctantly add the package options [sans-style=TeX] and [sans-style=ISO] to control the behaviour of \mathsf. The TeX style sets up the command to use the seemingly-useless upright sans serif, including Greek; the ISO style switches to using italic in both Latin and Greek alphabets. In other words,

this option simply changes the meaning of \mathsf to either \mathsf up or \mathsfit, respectively. Please let me know if more granular control is necessary here.

There is also a [sans-style=literal] setting, set automatically with [math-style=literal], which retains the uprightness of the input characters used when selecting the sans serif output.

#### 3.3.1 What about bold sans serif?

While you might want your bold upright and your sans serif italic, I don't believe you'd also want your bold sans serif upright (or all vice versa, if that's even conceivable). Therefore, bold sans serif follows from the setting for sans serif; it is completely independent of the setting for bold.

In other words, \mathbfsf is \mathbfsfup or \mathbfsfit based on [sans-style=TeX] or [sans-style=ISO], respectively. And [sans-style=literal] causes \mathbfsf to retain the same italic or upright shape as the input, and turns it bold sans serif.

Note well! There is no medium-weight sans serif Greek alphabet in unicode; therefore, \mathsf{\alpha} does not make sense (simply produces ' $\alpha$ ') while \mathbfsf{\alpha} gives ' $\alpha$ '.

# 3.4 All (the rest) of the mathematical alphabets

Unicode contains separate codepoints for most if not all variations of alphabet shape one may wish to use in mathematical notation. The complete list is shown in table 3. Some of these have been covered in the previous sections.

At present, the math font switching commands do not nest; therefore if you want sans serif bold, you must write  $\mbox{mathsfbf}...$  rather than  $\mbox{mathbf}\mbox{mathsf}...$ }. This may change in the future.

#### 3.5 Miscellanea

#### 3.5.1 Nabla

The symbol  $\nabla$  comes in the six forms shown in table 4. We want an individual option to specify whether we want upright or italic nabla by default (when either upright or italic nabla is used in the source). TeX classically uses an upright nabla, but iso standards differ (I think). The package options nabla=upright and nabla=italic switch between the two choices. This is then inherited through \mathbf; \mathbf and \mathbf can be used to force one way or the other.

nabla=italic is implicit when using math-style=ISO and nabla=upright follows both math-style=TeX and math-style=French.

Table 3: Mathematical alphabets defined in unicode. Black dots indicate an alphabet exists in the font specified; grey dots indicate shapes that should always be taken from the upright font even in the italic style.

	Font				Alphab	et
Style	Shape	Series	Switch	Latin	Greek	Numerals
Serif	Upright	Normal	\mathup	•	•	•
		Bold	\mathbfup	•	•	•
	Italic	Normal	\mathit	•	•	•
		Bold	\mathbfit	•	•	•
Sans serif	Upright	Normal	\mathsfup	•		•
	Italic	Normal	\mathsfit	•		•
	Upright	Bold	\mathsfbfup	•	•	•
	Italic	Bold	\mathsfbfit	•	•	•
Typewriter	Upright	Normal	\mathtt	•		•
Double-struck	Upright	Normal	\mathbb	•		•
Script	Upright	Normal	\mathscr	•		
-		Bold	\matbfscr	•		
Fraktur	Upright	Normal	\mathfrak	•		
	. 0	Bold	\mathbffrac	•		

Table 4: The various forms of nabla.

Description	on	Glyph
Upright	Serif	$\nabla$
	Bold serif	$\nabla$
	Bold sans	?
Italic	Serif	$\overline{V}$
	Bold serif	abla
	Bold sans	?

Table 5: The various forms of the partial differential. Note that in the fonts used to display these glyphs, the first upright partial is incorrectly shown in an italic style.

Description	Glyph	
Regular	Upright	д
	Italic	д
Bold	Upright	9
	Italic	д
Sans bold	Upright	?
	Italic	?

#### 3.5.2 Partial

The same applies to the symbols u+2202: Partial differential and u+1D715: MATH ITALIC PARTIAL DIFFERENTIAL.

At time of writing, both the Cambria Math and STIX fonts display these two glyphs in the same italic style, but this is hopefully a bug that will be corrected in the future — the 'plain' partial differential should really have an upright shape.

Use the partial=upright or partial=italic package options to specify which one you would like. The default is (always, unless someone requests and argues otherwise) partial=italic.<sup>1</sup>

See table 5 for the variations on the partial differential symbol.

#### 3.5.3 Epsilon and phi: $\epsilon$ vs. $\epsilon$ and $\phi$ vs. $\varphi$

TeX defines \epsilon to look like  $\varepsilon$  and \varepsilon to look like  $\varepsilon$ . The Unicode glyph directly after delta and before zeta is 'epsilon' and looks like  $\varepsilon$ ; there is a subsequent variant of epsilon that looks like  $\varepsilon$ . This creates a problem. People who use unicode input won't want their glyphs transforming; TeX users will be confused that what they think as 'normal epsilon' is actual the 'variant epsilon'. And the same problem exists for 'phi'.

We have a package option to control this behaviour. With vargreek-shape=TeX, \phi and \epsilon produce  $\phi$  and  $\varepsilon$  and \varphi and \varepsilon produce  $\phi$  and  $\varepsilon$ . With vargreek-shape=unicode, these symbols are swapped. Note, however, that unicode characters are not affected by this option. That is, no remapping occurs of the characters/glyphs, only the control sequences.

Unless math-style=literal is in effect, the default is to use vargreek-shape=TeX.

<sup>&</sup>lt;sup>1</sup>A good argument would revolve around some international standards body recommending upright over italic. I just don't have the time right now to look it up.

```
A 0 1 2 3 4 5 6 7 8 9 + - = () i n Z
```

Figure 1: The unicode superscripts supported as input characters. These are the literal glyphs from Charis SIL, not the output seen when used for maths input. The 'A' and 'Z' are to provide context for the size and location of the superscript glyphs.

```
U+3B5: GREEK SMALL LETTER EPSILON
U+3F5: GREEK LUNATE EPSILON SYMBOL
U+3C6: GREEK SMALL LETTER PHI
U+3D5: GREEK SMALL LETTER SCRIPT PHI
```

#### **3.5.4** Primes

Primes (x') may be input in several ways. You may use any combination of ascii straight quote ('), unicode prime ('), and \prime; when multiple primes occur next to each other, they chain together to form double, triple, or quadruple primes if the font contains pre-drawn glyphs. These may also be accessed with \primedouble, \primetriple, and \primequadruple.

If the font does not contain the pre-drawn glyphs or more than four primes are used, the single prime glyph is used multiple times with a negative kern to get the spacing right. There is no user interface to adjust this negative kern yet (because I haven't decided what it should look like); if you need to, write something like this:

```
\ExplSyntaxOn
\muskip_gset:Nn \g_um_primekern_muskip { -\thinmuskip/2 }
\ExplySyntaxOff
```

#### 3.5.5 Unicode subscripts and superscripts

You may, if you wish, use unicode subscripts and superscripts in your source document. For basic expressions, the use of these characters can make the input more readable. Adjacent sub- or super-scripts will be concatenated into a single expression.

The range of subscripts and superscripts supported by this package are shown in figures 1 and 2. Please request more if you think it is appropriate.

#### 3.5.6 Colon ':'

The colon is one of the few confusing characters of unicode maths. In  $T_EX$ , : is defined as a colon with relation spacing: 'a:b'. While \colon is defined as a colon with punctuation spacing: 'a:b'.

 $A_{0\,1\,2\,3\,4\,5\,6\,7\,8\,9\,+\,-}$  = ( ) a e i o r u v x  $\beta$   $\gamma$   $\rho$   $\phi$   $\chi$  Z

Figure 2: The unicode subscripts supported as input characters. See note from figure 1.

Table 6: Slashes and backslashes.

Slot	Name	Glyph	Command
U+002F	SOLIDUS	/	\solidus
U+2044	FRACTION SLASH	/	\fracslash
U+2215	DIVISION SLASH	/	\slash
u+29f8	BIG SOLIDUS	/	\xsol
U+005C	REVERSE SOLIDUS	\	\backslash
U+2216	SET MINUS	\	\smallsetminus
U+29F5	REVERSE SOLIDUS OPERATOR	\	\setminus
U+29F9	BIG REVERSE SOLIDUS	\	\xbsol

In unicode, U+003A: COLON is defined as a punctuation symbol, while U+2236: RATIO is the colon-like symbol used in mathematics to denote ratios and other things.

This breaks the usual straightforward mapping from control sequence to unicode input character to (the same) unicode glyph.

To preserve input compatibility, we remap the ASCII input character ':' to U+2236: RATIO. Typing a literal U+2236: RATIO char will result in the same output. If amsmath is loaded, then the definition of \colon is inherited from there (it looks like a punctuation colon with additional space around it). Otherwise, \colon is made to output a colon with \mathpunct spacing.

The package option [colon=literal] forces ASCII input ':' to be printed as \mathcolon instead.

#### 3.5.7 Slashes and backslashes

There are several slash-like symbols defined in unicode. These are shown in table 6. The ASCII slashes / and \ are useful as input characters but should not be used in the rendering of mathematics. (I think.)

In regular LATEX we can write \left\slash...\right\backslash and so on and obtain extensible delimiter-like symbols. Not all of the unicode slashes are suitable for this (and do not have the font support to do it).

**Slash** Of u+2044: Fraction slash, TR25 says that it is:

...used to build up simple fractions in running text...however parsers of mathematical texts should be prepared to handle fraction slash when it is received from other sources.

If encountered in the input stream, therefore, I believe it should be mapped to the meaning of u+2215: division slash. (Alas, see the note below.)

U+2215: DIVISION SLASH should be used when division is represented without a built-up fraction;  $\pi \approx 22/7$ , for example.

I do not know what u+29F8: BIG SOLIDUS is intended to be used for. It's a 'math operator' (like  $\Sigma$ ) so it falls outside the topic of discussion here.

**Backslash** MathML uses U+2216: SET MINUS like this:  $A \setminus B$ .<sup>2</sup> I think the STIX name for this glyph slot should just be \setminus.

Presumably, U+29F5: REVERSE SOLIDUS OPERATOR is intended to be used in a similar way, but it could also (perhaps?) be used to represent 'inverse division':  $\pi \approx 7 \setminus 22.^3$ 

Again, I don't know what u+29F9: BIG REVERSE SOLIDUS is for. But it's not too important at this stage.

**How to use all of these things** Unfortunately, font support for the above characters/glyphs is rather spotty. In Cambria Math, the only slash that grows (say when writing

$$\left[\begin{array}{cc} a & b \\ c & d \end{array}\right] / \left[\begin{array}{cc} 1 & 1 \\ 1 & 0 \end{array}\right] \quad )$$

is the fraction slash, which we just established above is sort of only supposed to be used in text.

And none of the backslashes stretch. Which leaves me in a bit of a pickle. TEX has a stretchy backslash. Cambria Math does not. What will? And in which glyph slot? I give up, for now. This is an impossible problem.

All of the above characters are allowed to be used after \left, \middle, and \right. Only the font will know whether or not it will actually stretch, however. If you like you may redefine \slash and \backslash to fit your needs. Perhaps this will be a package option some day.

## 3.5.8 Normalising some input characters

I believe all variant forms should be used as legal input that is normalised to a consistent output glyph, because we want to be fault-tolerant in the input. Here are the duplicates:

<sup>&</sup>lt;sup>2</sup>§4.4.5.11 :// . 3. / / 3/

<sup>&</sup>lt;sup>3</sup>This is valid syntax in the Octave and Matlab programming languages, in which it means matrix inverse pre-multiplication. I.e.,  $A \setminus B = A^{-1}B$ .

```
U+251: LATIN SMALL LETTER ALPHA
U+25B: LATIN SMALL LETTER EPSILON
U+263: LATIN SMALL LETTER GAMMA
U+269: LATIN SMALL LETTER IOTA
U+278: LATIN SMALL LETTER PHI
U+28A: LATIN SMALL LETTER UPSILON
U+190: LATIN CAPITAL LETTER EPSILON
U+194: LATIN CAPITAL LETTER GAMMA
U+196: LATIN CAPITAL LETTER IOTA
U+181: LATIN CAPITAL LETTER UPSILON
(Not yet implemented.)
```

         #2\um@fontdimen@percent{11}\um@font#3
314
       \else
315
         #2#3%
316
       \fi
317
    \fi
```

#### 5 **Fundamentals**

# Enlarging the number of maths families

To start with, we've got a power of two as many \fams as before. So (from ltfssbas.dtx) we want to redefine

- 320 \def\new@mathgroup{\alloc@8\mathgroup\chardef\@cclvi}
- 321 \let\newfam\new@mathgroup

This is sufficient for LATEX's \DeclareSymbolFont-type commands to be able to define 256 named maths fonts. Now we need a new \DeclareMathSymbol.

# \DeclareMathSymbol for unicode ranges

This command is a bit funny at the moment; it doesn't define the actual macro for almost all of the symbols passed to it, but it does assign the \XeTeXmathchar.

- $\upsilon = 1 : Symbol, e.g., \alpha$ 
  - #2 : Type, e.g., \mathalpha
  - #3 : Math font name, e.g., operators
  - #4 : Slot, e.g., "221E
  - 322 \def \um@mathsymbol#1#2#3#4{
  - \expandafter\um@set@mathsymbol\csname sym#3\endcsname#1#2{#4}}

The final macros that actually define the maths symbol with X<sub>7</sub>T<sub>F</sub>X primitives.

\um@set@mathsymbol

- #1 : Symbol font number
- #2 : Symbol macro, e.g., \alpha
- #3 : Type, e.g., \mathalpha
- #4 : Slot, e.g., "221E

If the symbol definition is for a macro. There are a bunch of tests to perform to process the various characters.

324 \def\um@set@mathsymbol#1#2#3#4{

**Operators** In the examples following, say we're defining for the symbol  $\sum$ .

\ifx\mathop#3\relax

In order for literal unicode characters to be used in the source and still have the correct limits behaviour, big operators are made math-active.

The active math char is defined to expand to the macro \sumop.

- \begingroup 326
- \char\_make\_active:n {#4} 327

```
\global\mathcode#4="8000\relax
\um@scanactivedef #4 \@nil { \csname\cs_to_str:N #2 op\endcsname }
\endgroup
```

Some of these require a \nolimits suffix. This is controlled by the \um@nolimits macro, which contains a list of such characters. This list is checked dynamically because we're not interested in efficiency. Or something. This allows the list to be updated in the middle of a document.

Declare the plain old mathchardef for the control sequence \sum@sym.

Now define \sumop as \sum@sym, followed by \nolimits if necessary.

```
\cs_gset:cpn { \cs_to_str:N #2 op } {

\csname\string#2@sym\endcsname

\expandafter\in@\expandafter#2\expandafter{\um@nolimits}

ifin@

\expandafter\nolimits

ifi
}
```

Don't forget that the actual \sum macro is simply defined in terms of the literal unicode symbol!

```
341 \else
```

**Radicals** Needs to be before the delimiters because the radical is, for some reason, \mathopen.

```
\expandafter\in@\expandafter#2\expandafter{\um@radicals,}

\ifin@

\cs_gset:cpn {\cs_to_str:N #2 sign} { \XeTeXradical #1 #4 \relax }

\else

\else
```

**Delimiters** TODO: sort out which of these three declarations are necessary! (Definitely the first, to work with \left/\right.)

```
\ifx\mathopen#3\relax
\cs_gset:Npn #2 {\XeTeXdelimiter "\mathchar@type#3 #1 #4\relax}
\global\XeTeXdelcode#4=#1 #4\relax
\global\XeTeXmathcode#4="\mathchar@type#3 #1 #4\relax
\else
\ifx\mathclose#3\relax
\cs_gset:Npn #2 {\XeTeXdelimiter "\mathchar@type#3 #1 #4\relax}
\global\XeTeXdelcode#4=#1 #4\relax
\global\XeTeXdelcode#4=#1 #4\relax
\global\XeTeXmathcode#4="\mathchar@type#3 #1 #4\relax
\else
```

#### Accents

```
ifx\mathaccent#3\relax
    \cs_gset:Npx #2 {\XeTeXmathaccent "\mathchar@type#3 #1 #4\relax}
}
```

And finally, the general case. We define the unicode mathcode for the character. The macro is defined generically in terms of the unicode character.

\um\_set\_mathcode:nnnn

[For later] or if it's for a character code (just a wrapper around the primitive). Note that this declaration *isn't* global so that it can be constrained by grouping inside math alphabet switches.

```
366 \cs_set:Nn \um_set_mathcode:nnnn {
367 \XeTeXmathcode#1="\mathchar@type#2 \csname sym#3\endcsname #4\relax
368 }
```

#### 5.3 The main \setmathfont macro

Using a Range including large character sets such as \mathrel, \mathalpha, etc., is very slow! I hope to improve the performance somehow.

• Erase any conception LATEX has of previously defined math symbol fonts; this allows \DeclareSymbolFont at any point in the document.

```
370 \let\glb@currsize\relax
```

• To start with, assume we're defining the font for every math symbol character.

```
\let\um@char@range\@empty
let\um@char@num@range\@empty
```

• Tell fontspec that maths font features are actually allowed.

```
\@um@fontspec@featuretrue
```

• Grab the current size information (is this robust enough? Maybe it should be preceded by \normalsize).

\csname S@\f@size\endcsname

• Set the name of the math version being defined. (obviously more needs to be done here!)

```
375 \def\um@mversion{normal}
376 \DeclareMathVersion{\um@mversion}
```

Define default font features for the script and scriptscript font. (This needs to be generalised so users can override it.)

```
\tl_set:Nn \l_um_script_features_tl {ScriptStyle}
\tl_set:Nn \l_um_sscript_features_tl {ScriptScriptStyle}
\tl_set:Nn \l_um_script_font_tl {#2}
\tl_set:Nn \l_um_sscript_font_tl {#2}
```

Use fontspec to select a font to use. The macro \S@(size) contains the definitions of the sizes used for maths letters, subscripts and subsubscripts in \tf@size, \sf@size, and \ssf@size, respectively.

```
\setkeys*[um]{options}{#1}
381
     \edef\@tempa{\noexpand\zf@fontspec{
382
         Script = Math,
383
         SizeFeatures = {
            {Size = \tf@size-} ,
            {Size = \sf@size-\tf@size ,
             Font = \l_um_script_font_tl ,
             \label{lum_script_features_tl} $$ l_um_script_features_tl $$
            } ,
            {Size = -\sf@size},
             Font = \l_um_sscript_font_tl ,
             \l_um_sscript_features_tl
            }
393
         },
          \XKV@rm
395
       }{#2}
     }
397
     \@tempa
```

Probably want to check there that we're not creating multiple symbol fonts with the same NFSS declaration.

Check for the correct number of \fontdimens:

```
399 \font\um@font="#2"\relax
400 %% \ifdim \dimexpr\fontdimen9\um@font*65536\relax =65pt\relax
401 %% \@um@ot@math@true
402 %% \else
```

```
403 %% \PackageWarningNoLine{unicode-math}{
404 %% The~ font~ '#2' ~is~ not~ a~ valid~ OpenType~ maths~ font.~
405 %% Some~ maths~ features~ will~ not~ be~ available~ or~ behave~
406 %% in~ a~ substandard~ manner
407 %% }
408 %% \fi
```

If we're defining the full unicode math repetoire, then we skip all the parsing processing needed if we're only defining a subset.

 Math symbols are defined with \UnicodeMathSymbol; see section §5.3.1 for the individual definitions

```
\ifx\um@char@range\@empty
      \tl_set:Nn \um_symfont_tl {um@allsym}
410
     \PackageInfo{unicode-math}{Defining~ the~ default~ maths~ font~ as~ '#2'}
411
      \cs_set_eq:NN \UnicodeMathSymbol \um_process_symbol_noparse:nnnn
      \cs_set_eq:NN \um_mathmap:Nnn \um_mathmap_noparse:Nnn
      \cs_set_eq:NN \um_remap_symbol:nnn \um_remap_symbol_noparse:nnn
414
      \cs_set_eq:NN \um_maybe_init_alphabet:n \um_init_alphabet:n
415
416
    \else
      \stepcounter{um@fam}
417
      \tl_set:Nx \um_symfont_tl {um@fam\theum@fam}
      \cs_set_eq:NN \UnicodeMathSymbol \um_process_symbol_parse:nnnn
      \cs_set_eq:NN \um_mathmap:Nnn \um_mathmap_parse:Nnn
      \cs_set_eq:NN \um_remap_symbol:nnn \um_remap_symbol_parse:nnn
421
      \cs_set_eq:NN \um_maybe_init_alphabet:n \use_none:n
    \fi
```

Now defined \um\_symfont\_tl as the LATEX math font to access everything:

```
424 \DeclareSymbolFont{\um_symfont_tl}
425 {\encodingdefault}{\zf@family}{\mddefault}{\updefault}
```

And now we input every single maths char. See File II for the source to unicodemath. tex which is used to create unicode-math-table.tex.

```
\@input{unicode-math-table.tex}
```

#### Finally,

- Set up shapes for italic/upright or ordinary/var symbols as per package options.
- Remap symbols that don't take their natural mathcode
- Activate any symbols that need to be math-active
- Setup all symbols not covered by the table (mostly alphanumerics)
- Setup the maths alphabets (\mathbf etc.)

```
427 \um_setup_shapes:
428 \um_remap_symbols:
429 \um_setup_mathactives:
430 \um_setup_alphanum:
431 \um_setup_alphabets:
End of the \setmathfont macro.
432 }
433 \cs_new:Nn \um_setup_shapes: {
434 \um_setup_nabla:
435 \um_setup_partial:
436 }
```

#### 5.3.1 Functions for setting up symbols with mathcodes

\um\_process\_symbol\_noparse:nnnn
\um\_process\_symbol\_parse:nnnn

If the Range font feature has been used, then only a subset of the unicode glyphs are to be defined. See section §6.3 for the code that enables this.

```
437 \cs_set:Nn \um_process_symbol_noparse:nnnn {
438    \um@mathsymbol{#2}{#3}{\um_symfont_tl}{#1}
439 }
440 \cs_set:Nn \um_process_symbol_parse:nnnn {
441    \um@parse@term{#1}{#2}{#3}{
442    \um_process_symbol_noparse:nnnn{#1}{#2}{#3}{#4}
443  }
444 }
```

\um\_remap\_symbols:
\um\_remap\_symbol\_noparse:nnn
\um\_remap\_symbol\_parse:nnn

This function is used to define the mathcodes for those chars which should be mapped to a different glyph than themselves.

```
\cs_new:Nn \um_remap_symbols: {
               \mbox{ } \
              \um_remap_symbol:nnn{\\*}{\mathbin}{\"02217}\% text asterisk to "centred as-
                \bool_if:NF \g_um_literal_colon_bool {
                  \um_remap_symbol:nnn{'\:}{\mathrel}{"02236}% colon to ratio (i.e., punct to rel)
451
                \if@um@literal
                        \um_remap_symbol:nnn {\um@usv@Nabla}{\mathord}{\um@usv@Nabla}
452
                       \um_remap_symbol:nnn {\um@usv@itNabla}{\mathord}{\um@usv@itNabla}
453
                       454
                       \um_remap_symbol:nnn {\um@usv@itpartial}{\mathord}{\um@usv@itpartial}
455
                  \um_remap_symbol:nnn {\um@usv@Nabla,\um@usv@itNabla}{\mathord}{\um_Nabla_up_or_it_usv}
457
                  \um_remap_symbol:nnn {\um@usv@partial,\um@usv@itpartial}{\mathord}{\um_partial_up_or_it_usv
458
```

Some of these in the bfliteral block may be redundant, but that's okay:

```
\if@um@bfliteral
                   \um_remap_symbol:nnn {\um@usv@bfNabla
                                                                                                                                                     }{\mathord}{\um@usv@bfNabla}
461
                \um_remap_symbol:nnn {\um@usv@bfitNabla
                                                                                                                                              }{\mathord}{\um@usv@bfitNabla}
462
                \um_remap_symbol:nnn {\um@usv@bfsfNabla
                                                                                                                                              }{\mathord}{\um@usv@bfsfNabla}
463
               \um_remap_symbol:nnn {\um@usv@bfsfitNabla }{\mathord}{\um@usv@bfsfitNabla}
464
                \um_remap_symbol:nnn {\um@usv@bfpartial
                                                                                                                                              }{\mathord}{\um@usv@bfpartial}
465
               \um_remap_symbol:nnn {\um@usv@bfitpartial }{\mathord}{\um@usv@bfitpartial}
               \um_remap_symbol:nnn {\um@usv@bfsfpartial }{\mathord}{\um@usv@bfsfpartial}
               \um_remap_symbol:nnn {\um@usv@bfsfitpartial}{\mathord}{\um@usv@bfsfitpartial}
             \else
469
               \um_remap_symbol:nnn {\um@usv@bfNabla,\um@usv@bfitNabla}{\mathord}{\um_bfNabla_up_or_it_usv
470
               \um_remap_symbol:nnn {\um@usv@bfsfNabla,\um@usv@bfsfitNabla}{\mathord}{\um_bfsfNabla_up_or_:
471
               \um_remap_symbol:nnn {\um@usv@bfpartial,\um@usv@bfitpartial}{\mathord}{\um_bfpartial_up_or_:
472
               \label{thm:local_continuous} $$ \sup_{\substack{um\_vehap_{\sum_{i=1}^{n}}{\mathbf{\sum_{i=1}^{n}}}}} $$ it partial_{i} $$ i
             \fi
475 }
```

Where \um\_remap\_symbol: nnn is defined to be one of these two, depending on the range setup:

### 5.3.2 Active math characters

There are more math active chars later in the subscript/superscript section. But they don't need to be able to be typeset directly.

\um\_setup\_mathactives:

```
486 \cs_new:Nn \um_setup_mathactives: {
487 \um_make_mathactive:nNN {"2032} \primesingle \mathord
488 }
```

\um\_make\_mathactive:nNN

Makes #1 a mathactive char, and gives cs #2 the meaning of mathchar #1 with class #3. You are responsible for giving active #1 a particular meaning!

```
489 \cs_new:Nn \um_make_mathactive:nNN {
490 \XeTeXmathchardef #2 = "\mathchar@type #3
491 \csname sym\um_symfont_tl\endcsname
```

```
#1 \scan_stop:

493 \XeTeXmathcodenum #1 = "1FFFFF \scan_stop:
494 }
```

#### 5.3.3 Maths alphabets' character mapping

We want it to be convenient for users to actually type in maths. The ASCII Latin characters should be used for italic maths, and the text Greek characters should be used for upright/italic (depending on preference) Greek, if desired.

\um\_setup\_alphanum:

All symbols input that aren't defined directly in unicode-math-table.

```
495 \cs_set:Nn \um_setup_alphanum: {
496 \ifx\um@char@range\@empty
497 \um_map_chars_numbers:nn {\um@usv@num}{\um@usv@num}
```

#### Normal weight

```
498 \if@um@literal
499 \um_setup_literals:
500 \else
501 \um_setup_Latin:
502 \um_setup_latin:
503 \um_setup_Greek:
504 \um_setup_greek:
505 \fi
```

#### **Bold**

```
\if@um@bfliteral
       \um_setup_bf_literals:
     \else
       \if@um@bfupLatin
      \um_map_chars_latin:nn {\um@usv@bfupLatin,\um@usv@bfitLatin}{\um@usv@bfupLatin}
      \um_map_chars_latin:nn {\um@usv@bfupLatin, \um@usv@bfitLatin}{\um@usv@bfitLatin}
513
       \fi
       \if@um@bfuplatin
514
      515
516
      517
       \fi
       \if@um@bfupGreek
519
      \um_map_chars_greek:nn {\um@usv@bfupGreek,\um@usv@bfitGreek}{\um@usv@bfupGreek}
520
      \um_map_char:nn {\um@usv@bfvarTheta,\um@usv@bfitvarTheta}{\um@usv@bfvarTheta}
521
      \um_map_chars_greek:nn {\um@usv@bfupGreek,\um@usv@bfitGreek}{\um@usv@bfitGreek}
      \um_map_char:nn {\um@usv@bfvarTheta,\um@usv@bfitvarTheta}{\um@usv@bfitvarTheta}
```

```
525
        \if@um@bfupgreek
        \um_map_chars_greek:nn {\um@usv@bfupgreek,\um@usv@bfitgreek}{\um@usv@bfupgreek}
        \um_map_char:nn {\um@usv@bfvarepsilon,\um@usv@bfitvarepsilon}{\um@usv@bfvarepsilon}
        \um_map_char:nn {\um@usv@bfvartheta,\um@usv@bfitvartheta}{\um@usv@bfvartheta}
        \um_map_char:nn {\um@usv@bfvarkappa,\um@usv@bfitvarkappa}{\um@usv@bfvarkappa}
530
        \um_map_char:nn {\um@usv@bfvarphi,\um@usv@bfitvarphi}{\um@usv@bfvarphi}
        \um_map_char:nn {\um@usv@bfvarrho,\um@usv@bfitvarrho}{\um@usv@bfvarrho}
532

536
        \um_map_char:nn {\um@usv@bfvartheta,\um@usv@bfitvartheta}{\um@usv@bfitvartheta}
537
        \um_map_char:nn {\um@usv@bfvarkappa,\um@usv@bfitvarkappa}{\um@usv@bfitvarkappa}
        \um_map_char:nn {\um@usv@bfvarphi,\um@usv@bfitvarphi}{\um@usv@bfitvarphi}
        \um_map_char:nn {\um@usv@bfvarrho,\um@usv@bfitvarrho}{\um@usv@bfitvarrho}
        \um_map_char:nn {\um@usv@bfvarpi,\um@usv@bfitvarpi}{\um@usv@bfitvarpi}
541
        \fi
542
      \fi
543
    \else
: TODO: what is supposed to happen here?
    \fi
546 }
```

#### 5.3.4 Functions for setting up the maths alphabets

\um\_mathmap\_noparse:Nnn

- #1 : Maths alphabet, e.g., \mathbb
- #2 : Input slot(s), e.g., the slot for 'A' (comma separated)
- #3 : Output slot, e.g., the slot for 'A'

Adds  $\mbox{\sc harmonic}$  and  $\mbox{\sc harmonic}$  definition (e.g.,  $\mbox{\sc harmonic}$ ). Uses  $\mbox{\sc harmonic}$  definition (e.g.,  $\mbox{\sc harmonic}$ ). Uses  $\mbox{\sc harmonic}$  definition (below) to expand the name of the current symbol font.

```
547 \cs_set:Nn \um_mathmap_noparse:Nnn {
548 \clist_map_inline:nn {#2} {
549 \exp_args:No \um@addto@mathmap \um_symfont_tl {##1}{#1}{#3}
550 }
551 }
```

\um\_mathmap\_parse:Nnn

- #1 : Maths alphabet, e.g., \mathbb
- #2 : Input slot(s), e.g., the slot for 'A' (comma separated)
- #3 : Output slot, e.g., the slot for 'A'

When \um@parse@term is executed, it populates the \um@char@num@range macro with slot numbers corresponding to the specified range. This range is used to conditionally add \um\_set\_mathcode:nnnn declaractions to the maths alphabet definition (e.g., \um@mathscr).

\um@addto@mathmap

#1 : Math symbol font, always/usually the expansion of \um\_symfont\_tl

#2: Input slot, *e.g.*, the slot for 'A'

#3 : Maths alphabet, e.g., \mathbb

#4 : Output slot, e.g., the slot for 'A'

This macro is used so that  $\mbox{um\_symfont\_t1}$  can be expanded before entering the  $\g@addto@macro\ command$ .

```
\newcommand\um@addto@mathmap[4]{

\expandafter\g@addto@macro

\csname um_setup_\cs_to_str:N #3:\endcsname{

\um_set_mathcode:nnnn{#2}{\mathalpha}{#1}{#4}

}

}
```

# 5.4 (Big) operators

Turns out that X¬TEX is clever enough to deal with big operators for us automatically with \XeTeXmathchardef. Amazing!

However, the limits aren't set automatically; that is, we want to define, a la Plain TEX etc., \def\int{\intop\nolimits}, so there needs to be a transformation from \int to \intop during the expansion of \UnicodeMathSymbol in the appropriate contexts.

Following is a table of every math operator (\mathop) defined in unicode-math-table.tex, from which a subset need to be flagged for \nolimits adjustments. The limits behaviour as specified by unicode-math are shown (with grey 'scripts).

USV	Ex.	Macro	Description
U+0 <b>2</b> 140	<u></u>	\Bbbsum	DOUBLE-STRUCK N-ARY SUMMATION

```

\um@nolimits

This macro is a sequence containing those maths operators that require a \nolimits suffix. This list is used when processing unicode-math-table.tex to define such commands automatically (see the macro \um@set@mathsymbol on page 20). I've chosen essentially just the operators that look like integrals; hopefully a better mathematician can help me out here. I've a feeling that it's more useful not to include the multiple integrals such as **////,** but that might be a matter of preference.

```
567 \def\um@nolimits{
   \@elt\int\@elt\iint\@elt\iiint\@elt\oiint\@elt\oiint\@elt\oiint
   \@elt\intclockwise\@elt\varointclockwise\@elt\ointctrclockwise\@elt\sumint
   \@elt\intbar\@elt\intBar\@elt\fint\@elt\cirfnint\@elt\awint\@elt\rppolint
   \@elt\scpolint\@elt\npolint\@elt\pointint\@elt\sqint\@elt\intlarhk\@elt\intx
   \@elt\intcap\@elt\intcup\@elt\lowint
```

\addnolimits This macro appends material to the macro containing the list of operators that don't take limits. See example following for usage. Note at present that this command must have taken effect before \setmathfont.

```
574 \newcommand\addnolimits[1]{
    \expandafter\def\expandafter\um@nolimits\expandafter{\um@nolimits\@elt#1}
576 }
```

\removenolimits Can this macro be given a better name? It removes (globally) an item from the nolimits list. See example following for usage.

```
577 \def\removenolimits#1{
     \begingroup
578
       \def\@elt##1{
579
         \ifx##1#1\else
580
           \noexpand\@elt\noexpand##1
581
       \xdef\um@nolimits{\um@nolimits}
     \endgroup
585 }
```

#### **Radicals** 5.5

The radical for square root is organised in \um@set@mathsymbol on page ??. I think it's the only radical ever. (Actually, there is also \cuberoot and \fourthroot, but they don't seem to behave as proper radicals.)

Also, what about right-to-left square roots?

\um@radicals We organise radicals in the same way as nolimits-operators; that is, in a comma-

586 \def\um@radicals{\sqrt}

$$\sqrt[2]{1+\sqrt[3]{1+x}} \qquad \qquad \text{$$\operatorname{setmathfont{Cambria Math}}$} \\ \left[ \operatorname{sqrt[2]{1+sqrt[3]{1+x}}} \right]$$

#### 5.6 Delimiters

\left We redefine the primitive to be preceded by \mathopen; this gives much better spacing in cases such as \sin\left.... Courtesy of Frank Mittelbach:

http://www.latex-project.org/cgi-bin/ltxbugs2html?pr=latex/3853&prlatex/3754

- 587 \let\left@primitive\left
- 588 \def\left{\mathopen{}\left@primitive}

No re-definition is made for \right because I don't believe it to be necessary.

Some symbols that aren't mathopen/mathclose still need to have delimiter codes assigned.

Set up delcodes so that slashes and things can grow if the font supports it. This is just inserted here so the documentation works. It will be generalised soon.

589 \XeTeXdelcode"002F =4 "002F % ord 590 \XeTeXdelcode"005C =4 "005C % ord 591 \XeTeXdelcode"2044 =4 "2044 % bin 592 \XeTeXdelcode"2215 =4 "2215 % bin 593 \XeTeXdelcode"2216 =4 "2216 % bin 594 \XeTeXdelcode"29F5 =4 "29F5 % bin

# 6 Font features

\um@zf@feature

Use the same method as fontspec for feature definition (*i.e.*, using xkeyval) but with a conditional to restrict the scope of these features to unicode-math commands.

```
'newcommand\um@zf@feature[2]{

'newcommand\um@zf@feature
```

606 }

## 6.1 OpenType maths font features

```
607 \um@zf@feature{ScriptStyle}{
608 \zf@update@ff{+ssty=0}
609 }
610 \um@zf@feature{ScriptScriptStyle}{
611 \zf@update@ff{+ssty=1}
612 }
```

## 6.2 Script and scriptscript font options

```
613 \define@cmdkey[um]{options}[um@]{ScriptFeatures}{}
614 \define@cmdkey[um]{options}[um@]{ScriptScriptFeatures}{}
615 \define@cmdkey[um]{options}[um@]{ScriptFont}{}
616 \define@cmdkey[um]{options}[um@]{ScriptScriptFont}{}
```

## 6.3 Range processing

The 'ALL' branch here is deprecated and happens automatically.

```
617 \define@choicekey+[um]{options}{Range}[\@tempa\@tempb]{ALL}{
618  \ifcase\@tempb\relax
619  \global\let\um@char@range\@empty
620  \fi
621 }{
622  \xdef\um@char@range{#1}
623 }
```

Pretty basic comma separated range processing. Donald Arseneau's selectp package has a cleverer technique.

\um@parse@term

#1: unicode character slot

#2 : control sequence (character macro)

#3 : control sequence (math type)

#4 : code to execute

This macro expands to #4 if any of its arguments are contained in the commalist \um@char@range. This list can contain either character ranges (for checking with #1) or control sequences. These latter can either be the command name of a specific character, *or* the math type of one (*e.g.*, \mathbin).

Character ranges are passed to \um@parse@range, which accepts input in the form shown in table 11.

Start by iterating over the commalist, ignoring empties, and initialising the scratch conditional:

Table 11: Ranges accepted by \um@parse@range.

Input	Range
X	r = x
x-	$r \ge x$
-у	$r \leq y$
x-y	$x \le r \le y$

Match to either the character macro (\alpha) or the math type (\mathbin):

```
\expandafter\um@firstchar\expandafter{\@ii}
\ifx\@tempa\um@backslash
\expandafter\ifx\@ii#2\relax
\@tempswatrue
\else
\expandafter\ifx\@ii#3\relax
\@tempswatrue
\fi
\fi
\fi
```

Otherwise, we have a number range, which is passed to another macro:

```
637 \else
638 \expandafter\um@parse@range\@ii-\@marker-\@nil#1\@nil
639 \fi
```

If we have a match, execute the code! It also populates the \um@char@num@range macro, which is used when defining \mathbf (etc.) \mathchar remappings.

```
\if@tempswa
           \ifx\um@char@num@range\@empty
             \g@addto@macro\um@char@num@range{#1}
           \else
             \g@addto@macro\um@char@num@range{,#1}
           \fi
           #4%
         \fi
647
       \fi
648
    }
649
^{651} \def\um@firstof#1#2\@nil{#1}
652 \edef\um@backslash{\expandafter\um@firstof\string\string\@nil}
653 \def\um@firstchar#1{\edef\@tempa{\expandafter\um@firstof\string#1\@nil}}
```

```
'1' or '\a' or '\b' is included '1' or '\b' or '\c' is
included '3' or '\a' or '\b' is included'3' or '\a' or \um@parse@term{1}{\b}{\c} {\infty} or \\string\c' is included}
                    '\b' is included
```

```
\def\um@char@range{\a,2-4,\c}
{'1' or '\string\a' or '\string\b' is included}
{'3' or '\string\a' or '\string\b' is included}
```

\um@parse@range

Weird syntax. As shown previously in table 11, this macro can be passed four different input types via \um@parse@term.

```
def\um@parse@range#1-#2-#3\@nil#4\@nil{

## 6.4 Resolving Greek symbol name control sequences

\um@resolve@greek

This macro defines \Alpha...\omega as their corresponding unicode (mathematical italic) character. Remember that the mapping to upright or italic happens with the mathcode definitions, whereas these macros just stand for the literal unicode characters.

# 7 Maths alphabets mapping definitions

Algorithm for setting alphabet fonts. By default, when Range is empty, we are in *implicit* mode. If Range contains the name of the math alphabet, we are in *explicit* mode and do things slightly differently.

Implicit mode:

- Try and set all of the alphabet shapes.
- Check for the first glyph of the uppercase Latin alphabet to detect if the font supports each alphabet shape. (This doesn't work to distinguish Latin/Greek but we hope all maths fonts will have at least them!)
- For alphabets that do exist, overwrite whatever's already there.
- For alphabets that are not supported, *do nothing*. (This includes leaving the old alphabet definition in place.)

Explicit mode:

- Only set the alphabets specified.
- Check for the first glyph of the uppercase Latin alphabet to detect if the font contains the alphabet shape in the unicode math plane.
- For unicode math alphabets, overwrite whatever's already there.
- Otherwise, use the ASCII letters instead.

```

### 7.3 Definitions of the math symbols

Here we define every unicode math codepoint an equivalent macro name. The two are equivalent, in a \let\xyz=^^^1234 kind of way.

\um@scancharlet
\um@scanactivedef

We need to do some trickery to transform the \UnicodeMathSymbol argument "ABCDEF into the X\(\text{TEX}\) 'caret input' form \^^^abcdef. It is \(\text{very important}\) that the argument has five characters. Otherwise we need to change the number of \(^\text{chars}\).

To do this, turn ^ into a regular 'other' character and define the macro to perform the lowercasing and \let. \scantokens changes the carets back into their original meaning after the group has ended and ^'s catcode returns to normal.

```
1285 \begingroup
1286 \char_make_other:N \^
1287 \cs_gset:Npn \um@scancharlet#1="#2\@nil {
1288 \lowercase{
1289 \scantokens{\global\let#1=^^^^#2}
1290 }
1291 }
```

Making ^ the right catcode isn't strictly necessary right now but it helps to future proof us with, e.g., breqn.

```
\gdef\um@scanactivedef"#1\@nil#2{
        \lowercase{
          \tl_rescan:nn{
1294
            \ExplSyntax0n
            \char_make_math_superscript:N\^
1296
          }{
1297
            \global\def^^^*#1{#2}
1298
          }
1300
     }
1301
1302 \endgroup
```

Now give \UnicodeMathSymbol a definition in terms of \um@scancharlet and we're good to go. Make sure # is an 'other' so that we don't get confused with \mathoctothorpe.

```
\begingroup
1303
     \def\UnicodeMathSymbol#1#2#3#4{
       \um@scancharlet#2=#1\@nil
1306
     \char_make_other:N \#
     \@input{unicode-math-table.tex}
1309 \endgroup
Fix \backslash:
   \group_begin:
     \lccode`\*=`\\
1311
     \char_make_escape:N \|
1312
     \char_make_other:N \\
1313
     |lowercase{
1315 |group_end:|let|backslash=*}
```

# 8 Epilogue

Lots of little things to tidy up.

#### 8.0.1 Primes

We need a new 'prime' algorithm. Unicode math has four pre-drawn prime glyphs.

```
U+2032: PRIME (\primesingle): x'
U+2033: DOUBLE PRIME (\primedouble): x"
U+2034: TRIPLE PRIME (\primetriple): x"'
U+2057: QUADRUPLE PRIME (\primequadruple): x"''
```

As you can see, they're all drawn at the correct height without being superscripted. However, in a correctly behaviour OpenType font with the MATH table, we also see different behaviour after the ssty feature is applied:

```
u+2032: PRIME in the 'scriptstyle' font: х/
```

The shrinking and offsetting is done as it is turned into a superscript. This means, luckily, that by default things work nicely for single primes. We can write x-primesingle or x-primesingle and get: x' and x'. To support single primes, then, things are easier than in  $E^TE^X$ ; we can just map ' to \prime and not worry about it.

However, it would be nice to use the pre-composed primes above if they exist in the font; consider x''' vs. x'''. Our algorithm is

- Prime encountered; pcount=1.
- Scan ahead; if prime: pcount:=pcount+1; repeat.
- If not prime, stop scanning.
- If pcount=1, \prime, end.
- If pcount=2, check \primedouble; if it exists, use it, end; if not, goto last step.
- Ditto pcount=3 & \primetriple.
- Ditto pcount=4 & \primequadruple.
- If pcount>4 or the glyph doesn't exist, insert pcount \primes with \primekern between each.

```
\muskip_new:N \g_um_primekern_muskip
\muskip_gset:Nn \g_um_primekern_muskip { -\thinmuskip/2 }% arbitrary
```

<sup>1318 \</sup>num\_new:N \l\_um\_primecount\_num

```
\cs_new:Nn \um_nprimes:n {
    ^{
1320
      \primesingle
1321
      1323
1324
  \cs_new:Nn \um_nprimes_select:n {
1325
    \prg_case_int:nnn {#1}{
1326
     {1} { ^{\primesingle} }
1327
1328
      \um_glyph_if_exist:nTF {"2033} { ^{\primedouble} } {\um_nprimes:n {#1}}
1329
1330
     {3} {
      }
     {4} {
     \um_glyph_if_exist:nTF {"2057} { ^{\primequadruple} } {\um_nprimes:n {#1}}
1335
     }
1336
   }{
1337
     \um_nprimes:n {#1}
1338
    }
1340 }
```

Scanning is more annoying than you'd think because we want to support all three of  $\prime$ , ', and the unicode prime. And  $\prime$  doesn't work with mathactive chars

```
\cs_new:Nn \um_scanprime: {
1341
     \sum_{v \in \mathbb{N}} 1_{um\_primecount\_num}
1342
     \um_scanprime_collect:
1343

          }{
            \um_nprimes_select:n {\l_um_primecount_num}
1357
        }
1358
     }
1359
1360 }
```

```
1361 \cs_set_eq:NN \prime \um_scanprime:
1362 \group_begin:
1363 \char_make_active:N \'
1364 \char_make_active:n {"2032}
1365 \cs_gset_eq:NN '\um_scanprime:
1366 \cs_gset_eq:NN ^^^22032 \um_scanprime:
1367 \group_end:
```

#### 8.0.2 Unicode radicals

Undo the damage made to \sqrt:

```
\DeclareRobustCommand\sqrt{\@ifnextchar[\@sqrt\sqrtsign}
```

\r@@t #1 : A mathstyle (for \mathpalette)

#2 : Leading superscript for the sqrt sign

A re-implementation of LATEX's hard-coded n-root sign using the appropriate \fontdimens.

```
1369 \def\r@@t#1#2{
   \setbox\z@\hbox{$\m@th #1\sqrtsign{#2}$}
1370
   1371
   \raise \dimexpr(
     \um@fontdimen@percent{65}{\um@font}\ht\z@-
     1374
    )\relax
1375
    \copy \rootbox
1376
   1377
   \box \z@
1379 }
```

### 8.0.3 Unicode sub- and super-scripts

The idea here is to enter a scanning state after a superscript or subscript is encountered. If subsequent superscripts or subscripts (resp.) are found, they are lumped together. Each sub/super has a corresponding regular size glyph which is used by  $X_{\overline{A}}T_{\overline{E}}X$  to typeset the results; this means that the actual subscript/superscript glyphs are never seen in the output document — they are only used as input characters.

Open question: should the superscript-like 'modifiers' (U+1D2C: MODIFIER CAPITAL LETTER A and on) be included here?

First, the setup of each mathactive char:

```
1380 \prop_new:N \g_um_supers_prop
1381 \prop_new:N \g_um_subs_prop
1382 \cs_generate_variant:Nn \prop_gput:Nnn {Nxn}
1383 \cs_generate_variant:Nn \prop_get:NnN {cxN}
1384 \cs_generate_variant:Nn \prop_if_in:NnTF {cx}
```

```
\group_begin:
  % Populate a property list with superscript characters; their mean-
   ing as their key,
1389 % for reasons that will become apparent soon, and their replace-
   ment as each key's value.
1390 % Then make the superscript active and bind it to the scanning function.
1391 %
1392 % \cs{scantokens} makes this process much simpler since we can acti-
   vate the char
1393 % and assign its meaning in one step.

1516
       {\meaning\l_peek\_token}
1517
          \prop_get:cxN
1518
```

#### 8.0.4 Synonyms and all the rest

We need to change LaTeX's idea of the font used to typeset things like \sin and \cos:

```
1527 \def\operator@font{\um_setup_mathup:}
1528 \def\to{\rightarrow}
1529 \def\vec{\overrightarrow}
1530 \def\le{\leq}
1531 \def\ge{\geq}
1532 \def\neq{\ne}
```

Define \colon as a mathpunct ':'. This is wrong: it should be  $\upsilon+003A$ : colon instead!

## 8.0.5 Compatibility

Note that amsmath will always be loaded before unicode-math. (Conflicts occur if you try it the other way around.)

• Since the mathcode of `\- is greater than eight bits, this piece of \AtBeginDocument code from amsmath dies if we try and set the maths font in the preamble:

```
\@ifpackageloaded{amsmath}{
     \t1_remove_in:Nn \@begindocumenthook {
```

• This code is to improve the output of analphabetic symbols in text of operator names (\sin, \cos, etc.). Just comment out the offending lines for now:

```
\@ifpackageloaded{amsopn}{
           \cs_set:Npn \newmcodes@ {
             \mathcode`\'39
             \mathcode`\*42
1551
             \mathcode`\."613A%
1552
            \int \frac{1}{2} \cdot \frac{1}{2} \cdot \frac{1}{2}
1553
               \mathchardef\std@minus\mathcode`\-\relax
1554
         %
         % \fi
             \mathcode`\-45
1556
             \mathcode`\/47
1557
             \mathcode`\:"603A\relax
1558
           }
1559
         }{}
     Octothorpe is an odd one:
1561 \AtBeginDocument{
     \def\#{\mode_if_math:TF{\mathoctothorpe}{\char`\#}}
1563 }
     Overriding amsmath definitions:
   \AtBeginDocument{
1565
     \def\@cdots{\mathinner{\cdots}}
1566 }
     Interaction with beamer:
   \@ifclassloaded{beamer}{
     \ifbeamer@suppressreplacements\else
1568
       \PackageWarningNoLine{unicode-math}{
1569
         Disabling~ beamer's~ math~ setup.^^J
1570
         Please~ load~ beamer~ with~ the~ [professionalfonts]~ class~ option
1571
1572
       \beamer@suppressreplacementstrue
1573
     \fi
1574
1575 }{}
     The end.
1576 \ExplSyntaxOff
```

## File II

# STIX table data extraction

The source for the TEX names for the very large number of mathematical glyphs are provided via Barbara Beeton's table file for the STIX project (ams.org/STIX). A version is located at http://www.ams.org/STIX/bnb/stix-tbl.asc but check http://www.ams.org/STIX/ for more up-to-date info.

This table is converted into a form suitable for reading by XaTeX, and then hand-edited by the author; the result is unicode-math-table.tex.

A single file is produced containing all (more than 3298) symbols. Future optimisations might include generating various (possibly overlapping) subsets so not all definitions must be read just to redefine a small range of symbols. Performance for now seems to be acceptable without such measures.

```
#!/bin/sh
cat stix-tbl.txt |
awk '
```

If the USV isn't repeated (TODO: check this is valid!) and the entry isn't one of the weird ones in the big block at the end of the STIX table (TODO: check that out!)...

If the USV has a macro name, which isn't \text..., and isn't a single character macro (e.g., \#, \S, ...), and has a class, and it isn't reserved (*i.e.*, doubled up with a previously assigned glyph):

```
if (texname ~ /[\\]/ &&
substr(texname,0,5) != "\\text" &&
substr(texname,0,4) != "\\ipa" &&
substr(texname,0,5) != "\\tone" &&
substr(texname,3,1) != " " &&
class != " " &&
description !~ /<reserved>/ )
```

Print the actual entry corresponding to the unicode character:

Now replace the STIX class abbreviations with their TFX macro names.

```
_{23} sed -e ' s/{N}/{\mathbb{}} ' \
```

A 'fence' defined by the STIX table is something like \vert; in X\(\text{TEX}\) this is just a \mathord that will grow with the magic of \XeTeX\) athchardef.

Fixing up a couple of things in the STIX table.

```
-e 's/\^/\string^/ '> unicode-math.tex
```

## A Documenting maths support in the NFSS

#### A.1 Overview

In the following,  $\langle NFSS \ decl. \rangle$  stands for something like  $\{T1\}\{lmr\}\{m\}\{n\}$ .

Maths symbol fonts Fonts for symbols:  $\alpha$ ,  $\leq$ ,  $\rightarrow$ 

```
\DeclareSymbolFont{\(\lame\)}\(\lame\)}\(NFSS\) decl.\(\rangle\)
```

Declares a named maths font such as operators from which symbols are defined with \DeclareMathSymbol.

**Maths alphabet fonts** Fonts for ABC-xyz,  $\mathfrak{ABC}-\mathcal{X}\mathcal{Y}\mathcal{Z}$ , etc.

```
\DeclareMathAlphabet{\langle cmd \rangle} \langle NFSS \ decl. \rangle
```

For commands such as \mathbf, accessed through maths mode that are unaffected by the current text font, and which are used for alphabetic symbols in the ASCII range.

```
\DeclareSymbolFontAlphabet{\langle cmd \rangle}{\langle name \rangle}
```

Alternative (and optimisation) for \DeclareMathAlphabet if a single font is being used for both alphabetic characters (as above) and symbols.

**Maths 'versions'** Different maths weights can be defined with the following, switched in text with the \mathversion{\( (maths version \) \} \) command.

**Maths symbols** Symbol definitions in maths for both characters (=) and macros (\eqdef): \DeclareMathSymbol{ $\langle symbol \rangle$ }{ $\langle type \rangle$ }{ $\langle named font \rangle$ }{ $\langle slot \rangle$ } This is the macro that actually defines which font each symbol comes from and how they behave.

Delimiters and radicals use wrappers around TeX's \delimiter/\radical primitives, which are re-designed in XHTeX. The syntax used in LATeX's NFSS is therefore not so relevant here.

**Delimiters** A special class of maths symbol which enlarge themselves in certain contexts.

```
\label{limiter} $$ \operatorname{def}(symbol)_{\langle sym. font \rangle}_{\langle slot \rangle}_{\langle sym. font \rangle}_{\langle slot \rangle
```

**Radicals** Similar to delimiters (\DeclareMathRadical takes the same syntax) but behave 'weirdly'. \sqrt might very well be the only one.

In those cases, glyph slots in two symbol fonts are required; one for the small ('regular') case, the other for situations when the glyph is larger. This is not the case in  $X_TT_TX$ .

Accents are not included yet.

#### **Summary** For symbols, something like:

#### For characters, something like:

## File III

# X<sub>T</sub>T<sub>E</sub>X math font dimensions

These are the extended \fontdimens available for suitable fonts in XaTeX. Note that LuaTeX takes an alternative route, and this package will eventually provide a wrapper interface to the two (I hope).

\fontdimen	Dimension name	Description
10	ScriptPercentScaleDown	Percentage of scaling down for script level 1. Suggested value: 80%.
11	ScriptScriptPercentScale- Down	Percentage of scaling down for script level 2 (ScriptScript). Suggested value: 60%.
12	DelimitedSubFormulaMin- Height	Minimum height required for a delimited expression to be treated as a subformula. Suggested value: normal line height × 1.5.
13	DisplayOperatorMinHeight	Minimum height of n-ary operators (such as integral and summation) for formulas in display mode.
14	MathLeading	White space to be left between math formulas to ensure proper line spacing. For example, for applications that treat line gap as a part of line ascender, formulas with ink going above (os2.sTypoAscender + os2.sTypoLineGap – MathLeading) or with ink going below os2.sTypoDescender will result in increasing line height.
15	AxisHeight	Axis height of the font.
16	AccentBaseHeight	Maximum (ink) height of accent base that does not require raising the accents. Suggested: x-height of the font (os2.sxHeight) plus any possible overshots.
17	FLATTENEDACCENTBASE- HEIGHT	Maximum (ink) height of accent base that does not require flattening the accents. Suggested: cap height of the font (os2.sCapHeight).
18	SubscriptShiftDown	The standard shift down applied to subscript elements. Positive for moving in the downward direction. Suggested: os2.ySubscriptYOffset.
19	SubscriptTopMax	Maximum allowed height of the (ink) top of subscripts that does not require moving subscripts further down. Suggested: /5 x-height.

\fontdimen	Dimension name	Description
20	SubscriptBaselineDropMin	Minimum allowed drop of the baseline of subscripts relative to the (ink) bottom of the base. Checked for bases that are treated as a box or extended shape. Positive for subscript baseline dropped below the base bottom.
21	SUPERSCRIPTSHIFTUP	Standard shift up applied to superscript elements. Suggested: os2.ySuperscriptYOffset.
22	SUPERSCRIPTSHIFTUPCRAMPED	Standard shift of superscripts relative to the base, in cramped style.
23	SuperscriptBottomMin	Minimum allowed height of the (ink) bottom of superscripts that does not require moving subscripts further up. Suggested: ¼ x-height.
24	SuperscriptBaselineDrop- Max	Maximum allowed drop of the baseline of superscripts relative to the (ink) top of the base. Checked for bases that are treated as a box or extended shape. Positive for superscript baseline below the base top.
25	SubSuperscriptGapMin	Minimum gap between the superscript and subscript ink. Suggested: 4×default rule thickness.
26	SuperscriptBottomMax- WithSubscript	The maximum level to which the (ink) bottom of superscript can be pushed to increase the gap between superscript and subscript, before subscript starts being moved down. Suggested: /5 x-height.
27	SpaceAfterScript	Extra white space to be added after each subscript and superscript. Suggested: 0.5pt for a 12 pt font.
28	UpperLimitGapMin	Minimum gap between the (ink) bottom of the upper limit, and the (ink) top of the base operator.
29	UpperLimitBaselineRiseMin	Minimum distance between baseline of upper limit and (ink) top of the base operator.
30	LowerLimitGapMin	Minimum gap between (ink) top of the lower limit, and (ink) bottom of the base operator.

\fontdimen	Dimension name	Description
31	LowerLimitBaselineDrop- Min	Minimum distance between baseline of the lower limit and (ink) bottom of the base operator.
32	STACKTOPSHIFTUP	Standard shift up applied to the top element of a stack.
33	StackTopDisplayStyleShift- Up	Standard shift up applied to the top element of a stack in display style.
34	STACKBOTTOMSHIFTDOWN	Standard shift down applied to the bottom element of a stack. Positive for moving in the downward direction.
35	STACKBOTTOMDISPLAYSTYLE- SHIFTDOWN	Standard shift down applied to the bottom element of a stack in display style. Positive for moving in the downward direction.
36	StackGapMin	Minimum gap between (ink) bottom of the top element of a stack, and the (ink) top of the bottom element. Suggested: 3×default rule thickness.
37	STACKDISPLAYSTYLEGAPMIN	Minimum gap between (ink) bottom of the top element of a stack, and the (ink) top of the bottom element in display style. Suggested: 7×default rule thickness.
38	STRETCHSTACKTOPSHIFTUP	Standard shift up applied to the top element of the stretch stack.
39	STRETCHSTACKBOTTOMSHIFT- DOWN	Standard shift down applied to the bottom element of the stretch stack. Positive for moving in the downward direction.
40	STRETCHSTACKGAPABOVEMIN	Minimum gap between the ink of the stretched element, and the (ink) bottom of the element above. Suggested: UpperLimitGapMin
41	STRETCHSTACKGAPBELOWMIN	Minimum gap between the ink of the stretched element, and the (ink) top of the element below. Suggested: LowerLimitGapMin.
42	FractionNumeratorShiftUp	Standard shift up applied to the numerator.
43	FractionNumerator- DisplayStyleShiftUp	Standard shift up applied to the numerator in display style. Suggested: StackTopDisplayStyleShiftUp.

\fontdimen	Dimension name	Description
44	FractionDenominatorShift- Down	Standard shift down applied to the denominator. Positive for moving in the downward direction.
45	FractionDenominator- DisplayStyleShiftDown	Standard shift down applied to the denominator in display style. Positive for moving in the downward direction. Suggested: StackBottomDisplayStyleShiftDown.
46	FractionNumeratorGap- Min	Minimum tolerated gap between the (ink) bottom of the numerator and the ink of the fraction bar. Suggested: default rule thickness
47	FractionNumDisplayStyle- GapMin	Minimum tolerated gap between the (ink) bottom of the numerator and the ink of the fraction bar in display style. Suggested: 3×default rule thickness.
48	FractionRuleThickness	Thickness of the fraction bar. Suggested: default rule thickness.
49	FractionDenominatorGap- Min	Minimum tolerated gap between the (ink) top of the denominator and the ink of the fraction bar. Suggested: default rule thickness
50	FractionDenomDisplay- StyleGapMin	Minimum tolerated gap between the (ink) top of the denominator and the ink of the fraction bar in display style. Suggested: 3×default rule thickness.
51	SkewedFraction- HorizontalGap	Horizontal distance between the top and bottom elements of a skewed fraction.
52	SkewedFractionVertical- Gap	Vertical distance between the ink of the top and bottom elements of a skewed fraction.
53	OverbarVerticalGap	Distance between the overbar and the (ink) top of he base. Suggested: 3×default rule thickness.
54	OverbarRuleThickness	Thickness of overbar. Suggested: default rule thickness.
55	OverbarExtraAscender	Extra white space reserved above the overbar. Suggested: default rule thickness.

\fontdimen	Dimension name	Description
56	UnderbarVerticalGap	Distance between underbar and (ink) bottom of the base. Suggested: 3×default rule thickness.
57	UnderbarRuleThickness	Thickness of underbar. Suggested: default rule thickness.
58	UnderbarExtraDescender	Extra white space reserved below the underbar. Always positive. Suggested: default rule thickness.
59	RadicalVerticalGap	Space between the (ink) top of the expression and the bar over it. Suggested: 1¼ default rule thickness.
60	RADICALDISPLAYSTYLE- VERTICALGAP	Space between the (ink) top of the expression and the bar over it. Suggested: default rule thickness $+ \frac{1}{4}$ x-height.
61	RADICALRULETHICKNESS	Thickness of the radical rule. This is the thickness of the rule in designed or constructed radical signs. Suggested: default rule thickness.
62	RADICALEXTRAASCENDER	Extra white space reserved above the radical. Suggested: RadicalRuleThickness.
63	RadicalKernBeforeDegree	Extra horizontal kern before the degree of a radical, if such is present. Suggested: 5/18 of em.
64	RADICALKERNAFTERDEGREE	Negative kern after the degree of a radical, if such is present. Suggested: $-10/18$ of em.
65	RADICAL DEGREE BOTTOM- RAISE PERCENT	Height of the bottom of the radical degree, if such is present, in proportion to the ascender of the radical sign. Suggested: 60%.

## Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in roman refer to the code lines where the entry is used.
